NAVIGATING THE CATALOG

Quick Index: *A pictorial index*

- Picture examples to help you locate the pages of similar parts
- Section numbers correspond to the section numbers printed in the upper outside corner of each catalog page.

Alphabetical Index

- Allows you to check if we carry a specific product line.
- Popular categories are in bold type.

Numerical Index

- Gives you the capability to look up a part based on the Auveco part number

Helpful Tips

- All parts are displayed as actual size, unless labeled "not actual size" or is a picture accompanying a chart. As actual size you will be able to set a part on top of the picture to positively identify it.
- We have included Specification Charts to assist you in the identification of various types of fasteners. Charts can be found on the following pages:
 - Body Bolts- Pages: 38 & 80-81
 - Special Tapping Screws- Pages: 42-45 & 90-93
 - License Plate Screws- Pages: 63-64
 - Retainers- Pages: 509-523
 - Push-Type Retainers- Pages: 570-580

Charts list the pertinent dimensions, plating and color information, as well as the page number on which the actual size picture and application information is shown for each item.

- At the back of the catalog are two O.E.M. part number to Auveco part number Cross References.
- One of these interchanges is broken down by O.E. manufacturer i.e., General Motors, Ford, etc.
- The other interchange combines all O.E.M. numbers together and is sequenced strictly in alphanumeric order regardless of the manufacturer.

FASTENER TERMINOLOGY

Bolt: Externally threaded, headed fastener. Difference between a bolt and a screw: a bolt is generally used through a hole with a mating nut. A screw is used in a threaded hole without a nut.

Class of Thread: A system to distinguish thread tolerance differences. Classes 1A, 2A, and 3A apply to external threads. 1B, 2B, and 3B apply to internal threads. Classes 2 and 3 apply to both external and internal threads.

Crest: Outermost tip of male thread from the fastener cylinder, or innermost tip of female thread.

Driving Recess: Recess in the fastener head designed to accept a driving tool.

External Thread: Male thread. Thread outside of the cylinder surface.

Internal Thread: Female thread. Thread on the inside surface of a cylinder or cone.

Left-Hand Thread: Thread that winds counter-clockwise from the starting end of a fastener.

Right-Hand Thread: Thread that winds clockwise from the starting end of a fastener (viewed from starting end).

Major Diameter: Largest diameter of a screw thread on a straight thread. It is the diameter of an imaginary cylinder which would pass through the crest of an external thread or the root of an internal thread.

Minor Diameter: On a straight thread it is the diameter of an imaginary cylinder bounding the root of an external thread or the crest of an internal thread.

Nominal Diameter: Basic diameter that determines the size and dimensional limits of fasteners.

Pitch: Distance from a point of a screw thread to a corresponding point on the next thread measured parallel to the axis.

Screw: Headed fastener which is externally threaded.

Sems[®]: Pre-assembled screw and washer assemblies. Washers are placed on screws before roll threading. Threads of larger diameter than the washer hole thus prevent the washer from slipping off the screw.

Stud: Threaded rod at both ends or for entire length.

Tapping Screw: Hardened thread screw made to cut or form its own mating thread in an untapped hole.

Teks[®]: Screw which drills its own hole and then threads in.

Thread Pitch: Distance from the crest of one thread to the crest of another.

PLATINGS AND FINISHES

Finish	Color	Anti-Corrosion Properties	Characteristics and Uses	
Black Oxide	Black	Good (Interior Only): 8 Hour Salt Spray	Most Metals	Decorative finish. Used only on interior applications.
Black Zinc	Black	Excellent: 48 Hour Salt Spray	All Metals	Rich and lustrous. With or without lacquering.
Cadmium	Bright Silver-Gray Dull or Burnished	Very Good: 24 Hour Salt Spray	Most Metals	Non-porous metallic plating. Rich appearance, good rust resistance, low cost, good electrical conductivity. Bright silver- gray dull gray or black electroplated finish.
Chromium (Chrome)	Bright Blue-White	Excellent: 24 Hour Salt Spray	All Metals	Used when a beautiful finish is desired. Bright blue-white lustrous appearance. Electroplated.
Dichromate Dip	Rainbow	Excellent	All Metals	A yellow, brown, green or iridescent colored coating. Increases rust resistance. Add to Zinc or Cadmium plating.
E-Coat	Black	Excellent: 168 Hour Salt Spray	All Metals	Added protection containing corrosion inhibitors. Excellent for exterior applications.

Auveco flange bolts and locknuts form a strong and dependable fastening system that substantially cuts truck assembly, maintenance and repair costs. The flange bolts are made to IFI III industry standard specifications. When flange bolts are used in conjunction with the flange locknuts they form a 150,000 P.S.I. tensile strength fastening system equivalent to SAE J429, Grade 8 industry standard specification. Flat washers and lock washers are not needed with the flange bolts. Our flange fastening system also reduces the need for costly hole preparations such as deburring and countersinking.

J.I.S Small Head Cap Screws

J.I.S. B 1180 • I.S.O. Class 8.8

Heat Treated • Steel • Zinc Plated

J.I.S. fasteners have a smaller hex dimension (across the flats) than DIN or ISO metric fasteners. They fit in those tight spots where the hex of an ISO or DIN fastener is too large. J.I.S. fasteners are OEM equipment on many GM and Japanese import car applications.

THE PROBLEM

Original bolts & nuts are difficult to remove due to rust and the type of threading used at the factory. Ford uses self-threading tri-lobular bolts called TAPTITE2000®. The bolts are driven down into a nut plate attached to the frame that is not threaded. Once the bolts and nuts rust/oxidize they are nearly impossible to remove and often need to be cut off.

THE SOLUTION

Auveco's replacement bolt and nuts.

Standard threaded bolt and mating nut do not require the need of special tools. Bolts follow the head and shaft contours of the O.E. bolt which allow them to duplicate the original fit & function.

U.S.S., S.A.E. & Metric Bolt and Nut Gauge.

Excellent for sizing bolts, screws, nuts (USS, SAE, and Metric) and twist drills. Determine the bolt diameter by pushing the bolt through the sizing holes, as well as, gauges hex nuts and washers (USS & SAE) size. Metric hex nuts and washers can be measured by holding them under the metric holes.

The back of the gauge includes a feature for measuring U.S. and Metric thread pitch. Special notches on the front of the tool allow you to measure flat head metal and wood screws.

Made of sturdy, light weight green plastic that resists water, alcohol, oil and grease.

Metric Bolt & Nut Gauge

Determine the diameter of the bolts by pushing them through the holes. Measure the hex head of bolts and screws or the "across the flat" dimension of hex nuts in the recesses around the holes (listed as wrench size).

Right-hand side of tool measures thread pitch (1.00, 1.50, 1.75 & 2.00)

Threaded Inserts for Thin Material

The Auveco Thin Sheet Nutsert has been designed to provide a highly efficient method of securing threads from one side of the work, in materials generally too thin to support threads. Its performance has been proven in plastic, aluminum, mild steel and fiberglass. They can also withstand high loads without vibrating or loosening under extreme operating conditions. The Auveco Thin Sheet Nutsert is a tension fastener with high pull out, insuring no rotation or vibration where a cover plate is used. The system's unique blind tooling installs TSNs at consistent rates using unskilled labor.

How it Works

The Thin Sheet Nutsert, held securely by the tool, is placed into a prepared hole. Upon the tool's actuation, the threaded portion is pulled until the fastener's wall collapses radially outward, clinching it tight against the sheet. The tool is withdrawn, leaving the Thin Sheet Nutsert ready to receive a bolt or screw. This complete operation takes only a few seconds and can be performed by anyone.

Strength Tests: Torque Strength: with an attaching part over the Thin Sheet Nutsert, offering a bearing surface, the TSN will remain intact past the point of the screw or bolt breaking (head torqued off). In almost all cases the threads of the TSN will remain undistorted and serviceable; an exception to this statement is when an extremely high tensile bolt is used.

Steel: 1010 Low Carbon Steel, Type 11 Class 3 with Zinc Plate (Metric: Yellow Zinc Finish), Clear Chromate

Aluminum: Aluminum Alloy 5056, Plain Finish, Metric Class 6H, U.S. Class 2B

LARGE FLANGE THIN SHEET NUTSERT® INSERTS

U.S.S., S.A.E. & Metric – Steel & Aluminum

Sec. 09

The Large Flange system provides captive threads in materials too thin to independently support threads, or where costly tapping operations are to be eliminated. The Large Flange fastener can be used as a rivet to join materials that will ultimately have a separate component attached.

Materials: Low Carbon Steel, Zinc Plated
(Metric: Zinc & Yellow Plated)
Aluminum Alloy, Plain Finish

To Set 8-32, 10-24 and 10-32 Large Flange Nutserts, use tool 11805 and conversion kits listed on page 163.

Large Flange Nutserts, 1/4"-20, 5/16"-18 and 3/8"-16, require a pneumatic tool for installation. They cannot be set with 11805.

The Auveco Nutsert was developed to offer both the production-oriented designer and the engineer a unique and versatile anchor nut-type insert for high-speed installation. This Auveco system gives the designer the option to design for **blind** or **open** applications, eliminating and simplifying their design problems.

Our system provides a cost-saving method of installing clean, load-bearing steel threads in castings, fiberglass, fiberboard, plastics, wood or almost any ductile material more than .030" thick.

A simple hand tool installs the Nutsert, it is ready for use in seconds and no finishing is required after installation.

Auveco Nutsert's advanced design offers unlimited grip range in a minimum of sizes. Inventory is minimized to one body dimension per thread size; ideally suited for blind, buried and through holes. The ingenious "taper-lock" principle locks-in the Nutsert preventing spin or twist; installs in flat or curved surfaces and is self-tightening with repeated use. The unique design of the installation tool eliminates marring of the parent material surface

Vibration Proof Lock Washers

Zinc Flake Coated

For use with Grade 5, Grade 8 & ASTM 574 High Grade Bolts

These washers have cams or wedges on one side, a lead angle greater than a thread angle, and radial teeth or ribs on the other side. The washers are installed cam face to cam face. When tightening the fastener to preload, the teeth penetrate and seat against the joint material and the nut and/or fastener head. When subjected to vibration the interacting cams create a wedge action which prevents the fastener from vibrating loose.

Material: Carbon Steel

Hardness: Through Hardened: 465HVI

Routing Clips

A quick, economical method of fastening wires, tubes, hoses or rods from 1/4" to 1" diameter to metal, plastic or any other surface ranging from 1/32" to 1/8" thickness. Clips are molded of durable black nylon plastic. They snap into 1/4" diameter holes and are held firmly in place by flexible "snubber tips" which compensate for variation in wall thickness.

POP® MULTI-GRIP BLIND RIVETS

Functions in a Wide Range of Material Thickness

The Multi-Grip rivet will serve in applications where solid, soft materials and thicknesses normally require several rivet sizes. Oversize, irregular or misaligned holes are automatically compensated for by self-adjusting hole-filling capability. The mandrel head is retained in the rivet body, forming a tight, weather resistant seal.

What makes Avex different and better?

The Avex rivet adds important and exclusive features to those offered by ordinary blind rivets. The unique advantages designed into the Avex rivet allow for its use:

In wide-tolerance holes. Since the rivet can expand up to its own head diameter, accurate hole sizing or alignment is not necessary.

To pull sheets together. The extraordinary rivet tail expansion automatically effects superior clamp-up action on the parts being assembled.

Over a vast range of thicknesses. The "dubble-bubble" expansion feature offers the capability to fasten securely in both thick and thin grip ranges with a single length rivet.

While providing a sealed stem. The rivet material flows both behind and in front of the mandrel insuring a positively retained and sealed stem.

The System

Blind Installation: The single side installation feature of the Auveco Monobolt System allows one operator to produce high quality structural joints in seconds. Use of the Monobolt power tool does not require special skill or training, because the tool completely controls the installation cycle.

Multi-Grip: One size Monobolt fastener will function effectively in a wide range of material thicknesses (Example: .080" to .375"). This versatility decreases the potential for production errors and reduces fastener inventory requirements.

Uniform Clamping Action: Monobolt fasteners are engineered to draw materials together by developing positive clamping action.

Its Advantages

Structural Fastening: An installed Monobolt fastener yields high shear and tensile values. Conventional fasteners can be replaced by Monobolt without compromising structural requirements.

Positive Stem Retention: At the completion of the installation cycle, the stem is mechanically locked into the Monobolt shell, creating a vibration-proof joint of assured structural quality.

Flush Break Stem: Within the specific grip range for each size, Monobolt fastener, the stem is designed to break flush with the low profile head. Secondary finishing operations, such as grinding or milling, are not necessary to achieve good product appearance.

Complete Hole Fill: During installation, the Monobolt shell expands into 360° contact with the walls of the parent material. This feature, in conjunction with positive stem retention, produces weather resistant joints.

Quiet, Safe Installation: The Monobolt System, operating at 85db ("A" Weighted), complies with OSHA regulation governing plant noise levels and operator safety.

How it Works

1. The Monobolt fastener is loaded into the nose of the placing tool and inserted in a prepared hole. As the tool is actuated, the pulling jaws grip the Monobolt stem.

2. An axial pull draws the stem through the shell, expanding it radially. During this phase, the hole is completely filled and work pieces are drawn together.

3. When the stem reaches a pre-determined position within the Monobolt shell, it separates flush with the head profile regardless of work piece thickness. Simultaneously, the stem section remaining in the shell is mechanically locked in place by the Monobolt tool.

Interlock® Dome Head High Strength Rivets

High strength Interlock® rivets feature a positive mechanical locking system that provides superior holding power. This system also guarantees 100% mandrel retention that's visually verifiable.

SELF-PIERCING RIVETS

For Aluminum Body Fastening

Self-piercing rivets (SPR) join two or more pieces of material using a rivet without a pre-drilled hole. Self-piercing rivets are a semi-tubular rivet driven at high force through the material layers to be joined, into a die which causes the tail of the rivet to flare out and form a joint.

The process requires no hole preparation and delivers high static strength similar to, or better than, spot welding. This process produces a fatigue resistant joint that is stronger than spot welding and less susceptible to corrosion.

The use of coated, lightweight and high-strength materials, such as galvanized or pre-painted steel and aluminum makes welding these materials difficult and often not possible.

Self-Piercing Rivets for Aluminum & Steel Body Fastening

Self-piercing rivets (SPR) join two or more pieces of material using a rivet without a pre-drilled hole. Self-piercing rivets are a semi-tubular rivet driven at high force through the material layers to be joined, into a die which causes the tail of the rivet to flare out and form a joint.

The process requires no hole preparation and delivers high static strength similar to, or better than, spot welding.

This process produces a fatigue resistant joint that is stronger than spot welding and less susceptible to corrosion.

The use of coated, lightweight and high-strength materials, such as galvanized or pre-painted steel and aluminum makes welding these materials difficult and often not possible.

For general purpose use. Refer to application specifications when choosing the proper SPR.

- Material: Steel, H4 Hardness with patented Almac® Coating
- When using SPR rivets refer to the vehicle manufacturers (OEM) repair instructions. A test rivet should be set when the material or material thickness changes. These steps are the only way to obtain a reliable riveting process
- Used by many OE manufacturers

Abrasive Flap Discs

Flap discs use diagonal layers of sandpaper on a resin fiber backing. Flaps are glued onto a multi-layer fiberglass or plastic backing plate. New grit is continuously being exposed as the flaps wear down providing consistent performance throughout the life of the disc. The design of flap discs allows them to run cooler reducing warping of thin metals such as body panels.

Type 29 (Beveled) Flap Discs

- Grind and finish at the same time
- Conical flap discs (Type 29) are angled and designed to be used on contoured and edge work
- The angle provides greater surface contact for stock removal on flat surfaces
- Discs cut cleaner, faster and cooler reducing clogging and glazing
- Longer lasting than conventional fiber-backed abrasive discs
- For use on flat or curved surfaces
- Quieter than grinding discs
- For use on portable right-angle grinders
- Suitable for use on a wide variety of materials as well as all types of steel, including stainless steel

An individual panel measures 6-1/2" (wide) x 17-1/2" (front to back) x 44-1/2" (high). The merchandiser fits onto a gondola with 48" x 48" of pegboard or on any pegboard wall.

AuvecoPak packages feature, contemporary graphics with all the necessary application and descriptive information in trilingual verbiage (English, Spanish and French-Canadian).

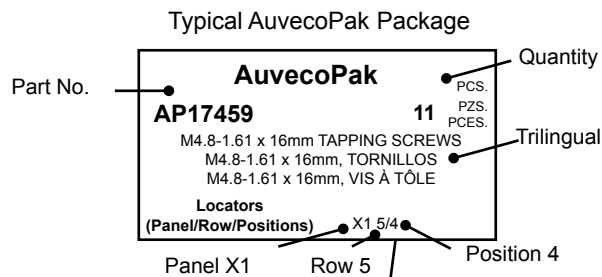

AuvecoPak part numbers are the same as standard Auveco part numbers with an "AP" prefix. Thus AP11146 is the AuvecoPak version of 11146.

Reordering is a breeze, the AuvecoPak part number and UPC-A bar code are on the panel back-up boards beneath each hook. Restocking is also quick and easy with the AuvecoPak packages' locator codes identifying their specific location on the panels.

A gondola is not included with the AP448 Auveco customer service reps can recommend a source for gondolas.

An AuvecoPak "Product Identification Guide" is provided with each merchandiser. The guide features actual size photos of all of the parts, along with complete descriptions, size dimensions and application information, as well as, each item's location (panel, row and position) on the merchandiser.

Pop on Screw Covers & Bases

Covers: Matte Finish

Ultra Violet Stabilized Polypropylene covers and bases help shield screws from corrosive environments. Their smooth finish forms a protective barrier against rough-edges.

For use with flat head and oval head tapping screws and round head machine screws.

They're simple to use:

1. Place washer over pilot or starting hole for screw, nail or rivet.
2. Install fastener
3. Place Snap Cap over washer at slight angle.
4. Simply push Snap Cap down firmly.

Door Hinge Pin & Bushing Repair Kits**

Why bother with the hassle of cutting and grinding off a worn door hinge and welding on a new one when you can repair the bad hinge in a fraction of the time?

With our Door Hinge Pin & Bushing Repair Kits, fixing sagging doors caused by worn hinges due to pin failure is quick. It's easy. It works. And you don't have to repaint the welded heat flash area.

Each kit is designed to repair one hinge and contains all the pins, bushings and related hardware to do the job.

Refer to Kit listings below and on following pages.

Photos not actual size.

Here's how it works:

1. Remove the door from the truck body
2. Remove the original equipment pin and bushings
3. Install the bushings into the hinge holes
4. Install the longer pin into the top hinge hole
5. Thread on the lock nut
6. Install the shorter pin into the bottom hinge hole
7. Place the washer and a nut on the shorter pin
8. Tighten the nut to pull the pin into place.
9. Slowly tighten both upper and lower lock nuts
10. Reattach the door to the truck body

Detailed instructions are included with the kit.

European Style Hose Clamps

DIN 3017 • Stainless Steel Band & Housing • Zinc Plated Steel Screw

Unique off-set non-welded design of the housing provides resistance to over-tightening damage to the hose. The short housing saddle gives a smooth underside ensuring high sealing efficiency. These clamps are original equipment on both domestic and import vehicles. They are particularly suited for fuel, vacuum, water, emission and heater hoses and can be used with silicone hoses.

O.E.M. INTERCHANGE BY NUMERICAL ORDER

The O.E.M. numbers listed in this interchange are cross referenced to the closest equivalent Auveco part. In some instances, the parts are not identically the same. There may be slight differences in the finish, length or washer outer diameter; however, the Auveco part is designed to service the same application.

This interchange is arranged numerically in ascending order regardless of the number of digits in each O.E.M. number. Thus every number that begins with a 1 is listed before any number that begins with a 2. You should key on the first four digits to locate the number. For example, 1121865 is located before 11229 and after 11189734.

OEM numbers that begin with a letter precede OEM numbers that begin with a numeral.

BODY HARDWARE DEFINITIONS AND USAGE

Barrel Nuts: They are used with either stud-type or threaded fasteners where the other side of the panel is inaccessible. Typical applications include automotive nameplates on fenders, trunks, etc. The nut snaps into a pre-drilled hole and the metal tabs lock it into place. Also called tubular nuts.

Body Bolts: Usually either a hex washer head or hex head Sems® with the most common thread types being USS coarse or metric regular pitch. They are used for attachment of fenders, radiators, hoods, trunks and general purpose fastening.

Bumper Bolts: Used to attach bumpers. They have either a USS coarse or metric regular pitch thread. Bumper bolts are usually zinc plated with a stainless steel capped head.

Cable Straps (Releasable): Made of either natural or black nylon. Used to bundle wires or harnesses. With a releasable tab that allows you to loosen or tighten the strap as needed.

Door Hinge Pins & Bushings: Components of the vehicle's door hinge assembly. Pins are made of steel or stainless steel. The bushings are made of bronze. The critical dimensions of the pins are the length, the diameter and the shoulder diameter (if applicable). The critical dimensions of the bushings are the inside diameter and the outside diameter. Some bushings have a splined outside diameter.

Door Lock Rod Clips: Used to attach the door lock rod to the door lock cylinder. The clips are made of either steel or nylon.

Door & Window Crank Handle Retaining Clip:

Usually made of copper plated spring steel, they are used to attach interior door and window crank handles.

Double End Drill Bits: For drilling holes for rivets or removing rivets. The double end feature gives you twice the "life" of the bit.

Extruded U-Nuts: Used on the edge of a panel so that the throat of the nut lines up with a hole in the panel. They allow for a certain degree of alignment before installation. The multi-thread feature gives it more strength and retention than a regular single thread U or J-nut. They have either a USS coarse thread or metric regular pitch thread. Extruded U-nuts are used with body bolts on door panels, hood hinges, fenders, radiators and for general purpose fastening.

Flat Nuts: Made of spring steel and used where the other side of the panel is easy to reach. They can be for either stud type or threaded fasteners. They are used throughout the car under the dashboard, in door panels, trunk area, fenders, etc.

Free Spinning Washer Nut: A hex nut with a captive free spinning washer. As the nut is tightened against a surface, a "wedging action" is produced to create a tight friction locking action. Some nuts may have grounding "teeth" on the underside of the washer. These nuts are available in both standard USS coarse and SAE fine thread as well as metric regular pitch. They are used with body bolts.

Headlight Adjusting Screw Assemblies: Two assemblies are usually required for each vehicle headlight. One assembly controls the vertical aiming and the other controls the horizontal aiming.

Headlight Component Retaining Clip: Used in the retention of Ford vehicle headlight components starting in 1989

Hex Flange Nuts: A standard hex nut with a "washer" permanently attached. Provides for greater retention than a standard hex nut because of the larger load bearing area.

Hood Adjusting Bolt & Bumper: A threaded steel bolt with a “captive” rubber bumper head. The bolt screws into the vehicle body and the rubber bumper portion softens the impact when the vehicle hood is closed.

J-Nuts: Shaped like the letter J. They are used the same as extruded U-nuts on the edge of a panel. Depending upon the thread size, they can be used with tapping screws or body bolts in instrument panels, under the hood for light-duty applications and door panels.

Expansion Nuts: For attaching outside rear view mirrors, roof racks, etc. They are installed into the sheet metal and then as a bolt is tightened, the body of the expansion nut collapses to form legs which grip the inside of the sheet metal. Auveco has a installation tool available for installing multiple nuts in a short period of time. Sometimes they have a plastisol sealer around the exposed part to form a water-tight seal.

License Plate Screws: Used to attach license plates. Can have either a tapping screw thread or a machine screw thread. Made of either steel (plated) or nylon.

Miscellaneous (Grille, Fascias, etc.) Fasteners: Usually made of steel and plated. There are numerous types of these fasteners that are used to attach radiator grilles, fascias, garnish moulding etc.

Moulding Clips: Used for attaching mouldings on doors, quarter panels, trunks, etc. They are made of nylon and are sometimes attached with a rivet or with a special tapping screw.

Nylon Nuts: Used with metal tapping screws throughout the car (interior & exterior) for attachment. As a tapping screw is installed, it cuts its own thread and spreads the bottom part of the nut apart securing it in place. Nylon nuts can be found in door panels, headlight/front-end applications, license plate brackets, arm rests, instrument panels and many other areas.

Push-On Retainers: A spring steel fastener that is pushed onto a non-threaded stud to grip it firmly.

Push-Type Retainers: They work by pushing in the center pin which spreads the prongs. They are used for retaining bumper guards, various fascia, splash shields, shrouds, etc. While they are designed to be reusable, they are made of nylon and are usually destroyed in a collision. They are sometimes referred to as rivet retainers or drive-type retainers.

Plug Buttons: Made of black polyethylene. They are used to plug holes in body panels.

Pushnut Bolt Retainers: A spring steel fastener that is pushed onto a screw or bolt to temporarily hold it in place until final assembly. They slide down smoothly on either fine, coarse or regular pitch threads and hold firmly at any point.

Retaining Clips: Used for retaining door panels, interior trim, hood insulation, weatherstrip, splash guards, headliners and various fascia. Although OEM interior retainers come in a large variety of colors, the aftermarket parts are usually black or natural nylon. The body shop paints them to match the application as needed. There are several different variations of design. These parts are usually destroyed when removed.

Reveal Moulding Clips: Used for attaching reveal moulding around windshields, back and side windows. Clips are held in place with a tapping screw, stud or rivet. The moulding snaps onto the clip.

Rivets: Used for attachment in many different areas. The critical dimensions are the diameter of the rivet body and the grip range or panel thickness. There's no way to determine what the grip range is by measuring the rivet. That's an engineered specification that has to be given. Rivets can be made of steel, stainless steel, aluminum or nylon (usually black). The mandrel is the part that breaks off when the rivet is installed.

Rubber Caps: Made of special heat resistant EPDM rubber. Used for capping lines and hoses when testing carburetors, emission control systems, vacuum lines, etc. and to cover exposed threads.

Screw Grommets: A variation of the nylon nut. They are used with metal tapping screws throughout the vehicle (interior and exterior). They're installed in a pre-punched hole or slot in sheet metal. The tapping screw cuts its own thread as it's installed. They are mostly found in Japanese cars.

Sems®: A screw/bolt with a free spinning washer attached to it. As the screw is tightened a "wedging action" is produced to create a tight friction locking action. The Sems® feature is found on both body bolts and tapping screws.

Shims: Made of low carbon, non-heat treated steel. They are used for wheel alignment as well as spacers in the alignment of hoods, panels, etc. The critical dimensions are the thickness (1/64", 1/32", 1/16", 1/8") and the slot width.

Speed Nut: A term for a variety of types of nuts. Refer to flat nuts, barrel nuts, U-nuts, J-nuts, tubular nuts and extruded U-nuts.

Spin Lock Nuts: A hex flange nut with serrations under the flange for locking purposes. The serrations or grooves dig into the bearing surface during final tightening. They are used with body bolts.

Tapping or Trim Screws: Generally used for retention of interior and exterior mouldings, trim, dash panels, etc. Can be used with nylon nuts, screw grommets or installed directly into sheet metal. They cut or form a thread when driven into a performed hole. There are many varieties available - Phillips flat top washer head, pan head, Phillips oval head, hex head, hex washer head, etc. you can have Phillips oval head screws with undersized heads such as a #8 screw with a #6 head. Such a screw is used where the original fasteners was a #6 screw but now needs to be replaced with a #8 screw yet the application still requires a #6 head.

Teks®: A screw with a drill point that drills its own hole as it is installed. Most Auveco Teks® screws have a #2 point which is recommended for material up to .110" thick. The higher the drill point number, the thicker that material it can drill through. Once the metal is penetrated, the Teks® fastener functions as a conventional tapping screws.

Thread Cutting Nuts: A flanged type fastener nut with a hex drive that cuts its own thread when installed on a mild steel, brass, aluminum or plastic stud. Because of their prevailing torque, they provide excellent vibration resistance. They can be found on instrument panels, trunk area, fenders, door panels, etc.

Torx®: A drive system on screws and bolts that features six points. Can be either an internal or external Torx®. The Torx® system is a more positive drive system than a Phillips or slotted.

Trim Panel Clips & Fasteners: Can be made of metal or nylon. Used for retaining door and interior trim panels. The head of the fastener slides into a slit in the trim panel and then the fastener stem is pushed into a hole in the sheet metal. These parts are often damaged when removed.

Tubular Nuts: They are used with either stud-type or threaded fasteners where the other side of the panel is inaccessible. Typical applications include automotive nameplates on fenders, trunks, etc. The nut snaps into a pre-drilled hole and the metal tabs lock it into place. They are also called barrel nuts.

U-Nuts: Used the same as extruded U-nuts, on the edge of a panel, but do not possess the same “retention power” due to the lack of the extruded feature. Depending upon the thread size, can be used with tapping screws or body bolts in door panels, under the dash and light duty under the hood applications.

Universal Moulding Fasteners: A universal type of fastener for attaching older style mouldings that have lips or curls on the underside. The spring steel arm provides the tension holding the moulding strip. With the perforated plate type, you can break off the plate at 1/16” intervals to fit the moulding. You need to be able to access the back of the panel so you can install a hex nut.

Washer Head: A screw/bolt with the washer permanently attached to it. Also called flanged head. The washer head eliminates the need for a separate washer while increasing the load bearing area of the head. Used under the hood, on fenders, doors, front end applications, etc.

Washer Lock Nuts: Integral washers on these fasteners span slots or clearance holes. The spring locking action and the resilience of the washer provides a firm fastening when assembled with a screw or bolt. They are used in instrument panels, doors, trunks, etc.

Well Nuts: Primarily used to attach luggage racks but ideal for many other applications. Consists of a flanged neoprene rubber bushing with a brass machine nut molded into one end. Tightening a conventional machine screw threaded in the brass nut causes the insert to expand, making a secure fastening.

Wire Loom Clips: Used to hold wire loom (split flexible tubing) in place on underhood applications.

“Xmas Tree” Retainers: Used for retaining door panels, interior trim, hood insulation, weatherstrip, splash guards, headliners and various fascia. Although OEM interior retainers come in a large variety of colors, the aftermarket parts are usually black or natural nylon. The body shop paints them to match the application as needed. There are several different variations of design. The multi-head type twists into a slit on the trim panel and then the stem gets popped into a hole in the sheet metal. These parts are usually destroyed when removed.
