Philosophy & Business Model

Corporate Philosophy: Global Presence

As a comprehensive cutting tool manufacturer, we make products that at a fundamental level contribute to enhancing people's quality of life. Through continuous growth, we have established a production, sales and technical support network spanning 33 countries.

Our corporate aim is to continue to expand our operations globally and strengthen our contribution to manufacturing industries worldwide.

Business Model

Customer communication is at the heart of the OSG brand. We anticipate, listen and actively react to customer needs through on-site face-to-face support. OSG's vast global network provides our production sites with accurate feedback about user needs so that they can quickly design, develop, manufacture and deliver products that precisely meet those needs.

shaping your dreams

The power of OSG lies in our assured innovative technological know-how for producing high-quality and high-performance products; our exceptional services to respond to situations diligently; and our out-of-the-box thinking to provide total solutions that anticipate our customers' needs. We are committed to contribute to the advancement of the manufacturing industries by shaping our customers' dreams into reality.

The Power to Exceed Customers' Expectations

Message from the President

Shaping Customers' Dreams as a Comprehensive Cutting Tool Manufacturer

OSG Corporation has succeeded in maintaining steady growth over the past 80 years. We would like to express our heartfelt gratitude to the support of our customers, business partners and shareholders for contributing to OSG's tremendous global success today.

Ever since the company's establishment in 1938, OSG has been committed to developing quality products that truly exceed the expectations of each customer. This spirit remains alive in all facets of our operation today, and has given OSG the strength to challenge the status quo and deliver products and services in sync with manufacturing needs of the times. Our corporate tagline "shaping your dreams" summarizes this passion for new challenges and commitment to transforming each and every one of our customers' dreams into reality.

While the manufacturing industry is consistently evolving through the new discovery of materials and technologies, OSG is poised for continued growth by responding with new innovations. OSG will continue to support the global manufacturing industries while living up to our stakeholders' trust and expectations. We thank you for your continuous and enthusiastic support for OSG Corporation, a company that keeps evolving without forgetting its origin.

Jeff Tennant
President of OSG USA

OSG USA's Mission

It is the role of OSG USA, as well as its subsidiary companies, to carry out the core philosophy of our parent company.

OSG USA's mission is to contribute to the advancement of the manufacturing industry and society through innovative technology and superior quality products.

At OSG we are committed to providing our customers with the most cost effective quality products and the best service in the industry.

Our experienced staff strives to not only provide solutions but also works with our customers to improve processes through innovative strategies.

A Commitment to Quality that Withstands the Test of Time

In March 1938, Hideo Osawa established OSG Grinding Co., Ltd. to achieve domestic production of high-quality taps. Thirty years later, OSG's first overseas subsidiary was established in the United States. Based on the corporate philosophy of "global presence," OSG has since then built a production, sales and technical support network spanning 33 countries. With over 50 years of experience in developing new markets and human assets, OSG will continue its global expansion and contribute to the advancement of the manufacturing industry worldwide.

March 1938

- Hideo Osawa established OSG Grinding Co., Ltd. in Tokyo
- Began manufacturing taps and dies

May 1942

- Began manufacturing and sales of screw gauges

May 1943

- Established Aichi Factory (now OSG Academy)

May 1963

- Began manufacturing and sales of flat rolling dies

August 1956

- Began manufacturing and sales of cylindrical rolling dies

April 1961

- Toyokawa Factory began operation

August 1970

- Began manufacturing and sales of HSS end mills

1970

December 1971

- Toyohashi Factory began operation

June 1968

- First overseas subsidiary, OSG Tap & Die, Inc., opens in the USA

March 1967

- Oike Factory began operation

June 1963

- Changed the company name to OSG MFG. Company

December 1963

- Separated sales department and established OSG Corporation

March 1984

• Began manufacturing and sales of drills

February 1987

• Began manufacturing and sales of cutter bodies

September 1980

• Began manufacturing and sales of carbide end mills

1990

November 1990

• Yana Factory began Operation

June 1982

• Shinshiro Factory began operation

1980

2000

June 2010

• Began sales of OSG Phoenix, an indexable tooling series

2010

September 2014

• Introduces "The A Brand" product brand

November 2014

• Achieved consolidation net sales of 100 billion yen in FY2014

December 2004

• Established Design Center

January 1998

• Established Hongu Center

December 2006

• Established Global Technology Center

September 2017

• Established D-Lab

December 1992

• OSG MFG. Company and OSG Corporation were merged into OSG Corporation

February 1993

• Relocated corporate headquarters to Toyokawa, Aichi

December 1998

• Established CS Center

2018

• OSG celebrates its 80th anniversary
• OSG USA, Inc. celebrates its 50th anniversary

Core Products

Supporting Global Manufacturing with Top Class Products and Technology

OSG maintains absolute control over every aspect of its manufacturing capabilities. OSG products are produced in-house - from the production of tool material, creation of tool geometry, to the development of its own proprietary coatings - the 3 vital elements in the manufacturing of superior cutting tools.

Taps

Taps are used to cut screw threads on the inside surfaces of holes, creating the "female" half (nut) of the screw. High precision is of vital importance, particularly in areas such as automobile engines, which require precision screws. OSG offers a lineup of taps with diameters in various sizes and with specifications suitable for a wide variety of uses.

Drills

Drills are used to make holes in a wide range of surfaces. OSG has received high acclaim for the development of high-precision, high-value-added products for manufacturing use in automotive and aircraft part manufacture, which demands advanced processing techniques and zero margin of error.

End Mills

End Mills are used to cut and contour molds for plastic parts, which include electric home appliances, die-casting dies for automotive parts and stamping molds. To meet today's demanding requirements (smaller size, lower weight and reduced cost), OSG has developed many carbide end mills that are excellent in both processing accuracy and durability.

Rolling Dies

Thread rolling dies are used to copy threading onto "Male" screws (bolts); the process consists of rolling a metal bar between two thread rolling dies tightly pressed to each side. OSG manufactures cylindrical and flat rolling dies for screws, worms and serrations, thread rolling planetary dies and contour-flow rolling dies, in accordance with their intended use.

Indexable Tools

Indexable tools are used to shape metal molds and machine parts. While end mills are used for finishing, indexable tools are intended for rough cutting and contouring, and use disposable inserts attached to the tool body.

Gauges

Gauges are used to inspect the final dimensions of screw threads and holes. OSG was an early adopter of changes in the Japan Industrial Standards (JIS). Today, we offer a range of screw gauges based on ISO standards. Precision checking is an extremely important process because of the trend toward increasing product precision and compliance with international standards.

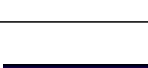

Surface Treatments

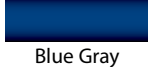

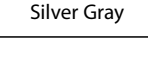

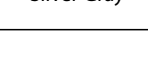

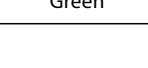

OSG Product Treatments

OSG's surface treatments are designed to meet customer needs through comprehensive technology by providing wear resistance, seizure resistance, corrosion resistance and mold release. OSG proprietary treatments provide a range of thicknesses, hardnesses and oxidation temperatures so you are sure to find the best match for any application.

Coating	Coating Color	Type	Thickness (µm)	Hardness (HV)	Oxidation Temp. (°C)	Application
 IchAda	 Black Gray	Cr	1~5	3100	1100	For drilling steel, stainless steel & hardened steel. A PVD coating with excellent surface smoothness and abrasion resistance, high surface hardness and heat resistance for small diameter tools.
 DUR	 Black Gray	Cr multilayer	1~5	3100	1100	For milling steel, stainless steel & hardened steel. A PVD coating with excellent surface hardness and wear resistance, excellent heat resistance and low coefficient of friction to reduce material adhesion.
 WD1	 Iridescent Blue	Cr multilayer	3~5	3300	1100	For drilling steel, stainless steel, cast iron & hardened steel. A PVD coating with excellent surface hardness and wear resistance, excellent heat resistance and low coefficient of friction to reduce material adhesion.
 EgiAs	 Iridescent Red	Nano multilayer	3~5	3200	1100	For drilling steel, stainless steel, cast iron, aluminum & hardened steel. A PVD coating with excellent surface hardness and wear resistance, excellent heat resistance and low coefficient of friction to reduce material adhesion.
 WXS	 Black Gray	SiC	1~5	3500	1300	For drilling, tapping & milling steel, stainless steel & hardened steel. A PVD coating with excellent surface hardness and wear resistance, excellent heat resistance and low coefficient of friction to reduce material adhesion.
 WXL	 Black Gray	Cr	1~5	3100	1100	For drilling & milling steel, stainless steel & hardened steel. A PVD coating with excellent surface hardness and wear resistance, excellent heat resistance and low coefficient of friction to reduce material adhesion.
 EXO	 Black Violet	TiAlN multilayer	3	2800	850	For drilling, tapping & milling steel, stainless steel, cast iron & heat resistant alloys. A PVD coating with high surface hardness and wear resistance, very good heat resistance and low coefficient of friction to reduce material adhesion.
 TiAlN	 Black Violet	TiAlN	3	2800	800	For drilling, tapping & milling steel, stainless steel, cast iron & heat resistant alloys. A PVD coating with high surface hardness and wear resistance, very good heat resistance and low coefficient of friction to reduce material adhesion.

Surface Treatments

Coating	Coating Color	Type	Thickness (µm)	Hardness (HV)	Oxidation Temp. (°C)	Application
 V	 Blue Gray	TiCN multilayer	3	2700	400	For drilling & tapping steel, stainless steel, aluminum & heat resistant alloys. A PVD coating with high surface hardness and wear resistance, good heat resistance and low coefficient of friction to reduce material adhesion.
 TiCN	 Blue Gray	TiCN	3	2700	400	For drilling, tapping & milling steel, stainless steel, aluminum & heat resistant alloys. A PVD coating with high surface hardness and wear resistance, good heat resistance and low coefficient of friction to reduce material adhesion.
 TiN	 Gold	TiN	3	2000	500	For drilling, tapping & milling steel, stainless steel, tool & die steel & aluminum. A PVD coating with good surface hardness and wear resistance, good heat resistance and low coefficient of friction to reduce material adhesion.
 SS	 Black Violet	TiAlN	1	2800	800	For drilling & tapping steel, stainless steel, & heat resistant alloys. A PVD coating with high wear & abrasion resistance, very good heat resistance and high surface smoothness to reduce material adhesion.
 HR	 Silver Gray	Ti	2	2800	700	For tapping stainless steel & heat resistant alloys. A PVD coating with high wear & abrasion resistance, very good heat resistance and high surface smoothness to reduce material adhesion.
 S/O	 Black	Steam-Oxide	-	-	-	For tapping steel, stainless steel, tool & die steel & nickel-alloys. The oxidized surface layer is porous and increases lubricity by retaining cutting fluid on the working area of the tool.
 Ni	 Silver Gray	Nitride	30~50	1000	-	For tapping cast iron, cast aluminum, & plastic. The case-hardened surface layer increases wear resistance in abrasive and tough materials.
 CrN	 Silver Gray	CrN	3	1800	700	For tapping non-ferrous materials. A PVD coating with high surface lubricity to reduce material adhesion applied over a case-hardened surface layer with increased wear resistance.
 DIA	 Black	DIA	20, 12	9000	600	For drilling, tapping & milling non-ferrous & composite materials. A CVD coating with superior surface hardness and wear resistance, outstanding durability, and excellent smoothness to reduce material adhesion.
 DLC	 Iridescent Green	DLC	0.2	6000	550	For milling non-ferrous materials. A PVD coating with excellent surface hardness and wear resistance, and very low coefficient of friction to reduce material adhesion.
 BR	-	-	-	-	-	For general machining of all materials. The uncoated substrate provides good wear resistance and durability in general machining applications.

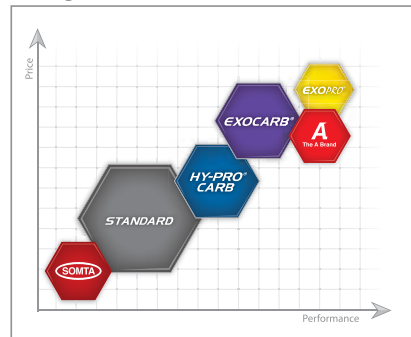

Brand Index

OSG Product Overview - The Total Solution

The purpose of this Brand Index is to illustrate OSG's Brand hierarchy and to better help you select the best tool for your machining needs.

From the value products under our Standard and HSS-Co brands to the high performance products under the V-Series, EXOCARB®, EXOPRO® and our new A Brand®, OSG offers a broad range of tools to meet your application requirements.

The A Brand Story

The A Brand® represent a new evolution in cutting tool technology. With a commitment to only the best, the A Brand® emanates innovations essential for shaping the future of global manufacturing.

The A Brand® is a premium tooling brand that represents OSG's quality assurance guarantee to each and every customer. The A Brand® products have been developed with attention to the finest details, while incorporating a versatility to enable a wide range of processing in various materials. With the capability to perform difficult processing tasks, and high efficiency the A Brand® products lend to shortened production time and cost savings.

The A Brand® products have been developed with OSG's latest tooling innovations in threading, drilling, and milling to bring an unparalleled experience to our manufacturers with the highest level of quality, reliability, and satisfaction that can only be delivered by the A Brand®, the tooling master class.

DRILLING

The A Brand®

OSG's premium tooling brand. Features products that are designed to exceed the evolving manufacturing needs of our customers.

EXOPRO®

OSG's ultra-premium tooling series. Features supreme performance carbide drills with OSG's proprietary coatings, like WD1, WXS® and DIA, for maximum cost-efficiency.

EXOCARB®

High performance sub-micrograin carbide drills with OSG's proprietary EXO®, WXS and SS coatings.

EXOCARB® MAX

Maximum performance carbide coolant-through drills for ultra high-speed drilling.

HY-PRO® CARB

Premium micrograin carbide drills with OSG WD1 coating. Perfect blend of performance and cost-efficiency.

CARBIDE

Micrograin carbide drills and reamers.

V Products

Premium powdered metal and cobalt high speed steel drills with OSG's proprietary V or WXL coating.

NEXUS

Premium high speed steel drills with OSG's proprietary WD1 coating.

EX-GOLD®

Premium high speed steel drills with TiN & TiAlN coating.

SOMTA

Value carbide and HSS-Co drills for a wide range of applications.

87700	2-6 Set	-	-	-	-	-	-	-	-	-

Packed: 1 pc.

Drills are available in 5pc sets (EDP 87700) for ØD through Ø6.

For drill diameter selection, use the method outlined below.

Straight Fluted & Spiral Fluted Taps: $0.46(\text{Tap } \varnothing) < (\text{Drill } \varnothing) < 0.75(\text{Tap } \varnothing)$

Spiral Pointed Taps: $0.6(\text{Tap } \varnothing) < (\text{Drill } \varnothing) < 0.75(\text{Tap } \varnothing)$

1. Broken Tap

Check how tap is broken. If any portion of the tap is protruding, grind the damaged surface of the tap flush with the workpiece. This will allow the damaged tap to be drilled easier.

2. Centering of Drill

Position the drill over the center of the tap. Please make sure both the workpiece and drill are properly secured. Make an initial light drill approach, and then quickly retract the drill. For this step, do not use lubrication.

3. Hole Processing

Drill the hole at a fixed feed and speed, stopping the operation occasionally to remove broken chips. In addition, use plenty of high quality cutting oil.

4. Chip Removal

Once the tap has been broken up, the remaining portions of the tap can be removed. For best results, use a scribe. Once the hole is cleaned, tapping can be resumed.

Cutting Conditions and Procedures to Note

1. Use a drilling speed of 65-80SFM.
2. Hand feed of 0.0005~0.001 in/rev is normal.
3. Use a rigid holder.
4. Select a high quality cutting oil and apply in sufficient amounts.
5. This tool should not be used to drill soft steels, aluminum alloys or other soft materials.
6. Resharpener should be done periodically.
7. For through hole processing of heat treated steels, use a spare piece of material underneath the material being drilled as this will prevent breakage caused by sudden torque.
8. **Cannot be used to remove forming taps.**

Note:

- The table above assumes a milled-flat surface and water soluble coolant.
- Use a rigid and precise machine and holder.
- Please minimize overhang length as much as possible during machining.
- Adjust the rotational speed and feed in accordance with conditions such as the machining shape, machine rigidity, or work holding.
- Please set up the drill so that the runout of the cutting edge is under 0.0008".
- Please select a cutting fluid that is most suitable for the work material with minimal smoke formation.
- In the case of dry machining, please use air blow to remove chips to prevent clogging.
 - Please do not machine stainless steel dry.
- When machining an inclined plane, adjust the rotational speed and feed in accordance with the angle of the incline (β).
 - When the machining incline angle (β) is less than 30°, please reduce the feed to 40-60%.
 - When the machining incline angle (β) is over 30°, please reduce the speed to 60-80%, the feed to 20-40%.
- Please use step drilling when drilling in pre-drilled holes to improve chip separation.
- If it is necessary to ensure the locating precision of the hole to be machined, adjust the rotational speed and feed as indicated above (in accordance with the machining precision requirement).
- Please always use the appropriate cutting fluid recommended by the cutting fluid manufacturer in the machining of magnesium alloys. Be cautious with the cutting chips as they are highly flammable and may pose a serious fire risk if not properly handled.

Note:

- The speeds and feeds in the table above apply when drilling on a flat surface with water-soluble coolant.
- When using non-water soluble oil or water-emulsifiable (over 20 times dilution), reduce cutting speed by 30%.
- Use a rigid and precise machine and holder.
- Please minimize tool overhang as much as possible during machining.
- Adjust the rotational speed and the feed rate in accordance with conditions such as the machining shape, machine rigidity, or work holding.
- Please set up the drill so that the runout of the cutting edge is under 0.0004 in.
- When machining an inclined plane, adjust the rotational speed and the feed rate in accordance with the angle of the incline (β).
 - When the machining incline angle(β) is less than 30°, please reduce the feed to 40-60%.
 - When the machining incline angle(β) is over 30°, please reduce the speed to 60-80% , the feed to 40-60%.
- Please use step drilling in pilot holes to improve cutting chip separation.
- If it is necessary to ensure the locating precision of the hole to be machined, adjust the rotational speed and the feed rate as indicated above (in accordance with the machining precision requirement).

Note:

- The speeds and feeds in the table above apply when drilling on a flat surface with water-soluble coolant.
- When using non-water soluble oil or water-emulsifiable (over 20 times dilution), reduce cutting speed by 30%.
- Use a rigid and precise machine and holder.
- Please minimize tool overhang as much as possible during machining.
- Adjust the rotational speed and the feed rate in accordance with conditions such as the machining shape, machine rigidity, or work holding.
- Please set up the drill so that the runout of the cutting edge is under 0.0004 in.
- When machining an inclined plane, adjust the rotational speed and the feed rate in accordance with the angle of the incline (β).
 - When the machining incline angle (β) is less than 30°, please reduce the feed to 40-60%.
 - When the machining incline angle (β) is over 30°, please reduce the speed to 60-80%, the feed to 40-60%.
- Please use step drilling in pilot holes to improve cutting chip separation.
- If it is necessary to ensure the locating precision of the hole to be machined, adjust the rotational speed and the feed rate as indicated above (in accordance with the machining precision requirement).

Note:

- The indicated speeds and feeds are for drilling with **water-soluble oil** or **MQL**.
- Suitable cutting fluid is water-soluble high density oil (less than 20 times dilution).
- When using non-water-soluble oil or water-soluble oil (over 20 times dilution), reduce cutting speed by 30%.
- These conditions are for drilling depth under 8 times the drill diameter.
- 1D-2D step feeding may be required for drilling high hardened steels and mid-range (8D) work.

Note:

- The indicated speeds and feeds are for drilling with **water-soluble oil** or **MQL**. (We do not recommend mist drilling with stainless steels.)
- Water-soluble oil (20-30 times dilution) is recommended.
- When using non-water-soluble oil, set the cutting speed between 70-100% of the lowest limit.
- Make a pilot hole before deep drilling; recommended operation is on pages 355-356.
- A clogged oil hole can lead to breakage. Make sure that a filter is attached to the oil feeder.
- Peck drilling of 1D-2D is strongly recommended in high hardness materials.

Note:

- The indicated speeds and feeds are for drilling with **water-soluble oil** or **MQL**. (We do not recommend mist drilling with stainless steels.)
- Water-soluble oil (20-30 times dilution) is recommended.
- When using non-water-soluble oil, set the cutting speed between 70-100% of the lowest limit.
- Make a pilot hole before deep drilling; recommended operation is on pages 355-356.
- A clogged oil hole can lead to breakage. Make sure that a filter is attached to the oil feeder.
- Peck drilling of 1D-2D is strongly recommended in high hardness materials.
- If, after piloting with ADO-5D and drilling with ADO-40D/50D, hole condition or accuracy is poor or machining is difficult, ADO-20D/30D may be used as an intermediate drilling step. This three-step process may improve accuracy and condition as well as permit more aggressive parameters than stated above.

Deep Hole Operational Guidelines

1. Make a pilot hole. (For 10-30D)

For a pilot hole, select 0.0008"-0.0031" (0.02-0.08mm) larger size drill than ADO 10D, ADO 15D, ADO 20D and ADO 30D. If the needed pilot drill size is not available, we recommend using the same diameter drill from ADO 3D.

1. Make a pilot hole. (For 40 & 50D)

For a pilot hole, select 0.0008"-0.0031" (0.02-0.08mm) larger size drill than ADO 40D and ADO 50D. If the needed pilot drill size is not available, we recommend using the same diameter drill from ADO 5D or ADO-TRS.

Remaining Steps are the Same for 10-50D

2. Insert the extra long drill into a pilot hole with zero or low revolution (below 500rpm).

3. Increase the revolution to the designated speed and start drilling.

4. After drilling, move the drill away from the bottom of the hole, then reduce its speed while pulling it out of the hole.

Make sure to use an internal coolant supply when drilling.

Drilling a Curved Surface

When working on a curved surface, we recommend piloting with A Brand[®] ADF flat drill.

Improve Accuracy & Hole Condition

If, after piloting with ADO-5D and drilling with ADO-40D/50D, hole condition or accuracy is poor or machining is difficult, ADO-20D/30D may be used as an intermediate drilling step. This three-step process may improve accuracy and condition as well as permit more aggressive parameters.

Stable Drilling with Long Drills

The runout of a gripped cutting tool increases with the speed, as shown in the graph on the right. To ensure a higher level of work stability, OSG recommends making +0.0008"-0.0031" (+0.02-0.08mm) pilot holes and inserting long drills stopped or at low speeds.

The reason for this is made evident in the graph on the right. Increasing the speed increases the dynamic runout, posing a higher risk of the drill not fitting properly in the pilot hole. Therefore, reducing the speed and minimizing static runout is the recommended drilling method for long drills.

Static runout RPM (min ⁻¹)	0"	0.0003"	0.0007"	0.0015"
1,000	0.0001	0.0005	0.0009	0.0018
3,000	0.0005	0.0010	0.0014	0.0025
5,000	0.0012	0.0015	0.0019	0.0034

Dynamic runout values for Ø6mm 30xD drill.

Note:

- The indicated speeds and feeds are for drilling with **water-soluble oil**.
- Suitable cutting fluid is water-soluble high density oil (less than 20 times dilution).
- When using non-water-soluble oil or water-soluble oil (over 20 times dilution), reduce cutting speed by 30%.
- These conditions are for drilling depth under 3 times the drill diameter.
- For machines that cannot achieve the speeds indicated in the table please set rotation as high as possible. Tool life may be reduced.

1. The indicated speeds and feeds are for drilling with water soluble oil.
2. When using non-water soluble oil, reduce the drilling speed by 20%.
3. When centering on a curved or inclined surface, reduce the feed rate accordingly.
4. For machines that cannot achieve the speeds indicated in the table, please set rotation as high as possible.

1. Use a water soluble oil with high density (5 to 10 times dilution).
2. Tight clamping is critical.
3. For drilling depth > 3D, use a step feed.
4. For materials susceptible to chip packing in the flute, apply a step feed.

List 5172 - EXOCARB® XH

Work Material	Broken Taps & Drills
Drilling Speed	65-80 SFM
Drill Dia. mm	Speed RPM
2	3,190 - 3,930
3	2,100 - 2,590
4	1,580 - 1,940
5	1,260 - 1,550
6	1,050 - 1,290
7	900 - 1,110
8	790 - 970
9	700 - 860
10	630 - 780
11	570 - 705
12	530 - 650

1. Use a drilling speed of 65-80 SFM.
2. Hand feed of 0.0005~0.001 in/rev is normal.
3. Use a rigid holder.
4. Select a high quality cutting oil and apply in sufficient amounts.
5. This tool should not be used to drill soft steels, aluminum alloys or other soft materials.
6. Resharpening should be done periodically.
7. For through hole processing of heat treated steels, use a spare piece of material underneath the material being drilled as this will prevent breakage caused by sudden torque.
8. Cannot be used to remove forming taps.

1. Please use in a machine with precise spindle rotation. Tight clamping is critical.
2. The indicated speeds and feeds are for drilling with water-soluble fluid.
3. Please use water-soluble high density fluid (less than 20 times dilution).
4. We recommend the pilot hole operation prior to EXOCARB® MAX-MINI (List 5310).
5. The run out with a drill in the spindle should be less than 0.0001".
6. OSG's Shrink Fit System is the recommended tool holder for these drills.

For machines that cannot achieve the speeds indicated in the above table, please set rotation as high as possible. Tool life may be decreased.

1. Please use in a machine with precise spindle rotation. Tight clamping is critical.
2. The indicated feeds and speeds are for drilling with water-soluble fluid.
3. Please use water-soluble high density fluid (less than 20 times dilution).
4. These tables are applicable for less than 3xD deep drilling operations.
When drilling deeper than 3xD, please peck every 0.25-0.5xD accordingly.
5. The run out with a drill in the spindle should be less than 0.0001".
6. OSG's Shrink Fit System is the recommended tool holder for these drills.

For machines that cannot achieve the speeds indicated in the above table, please set rotation as high as possible. Tool life may be decreased.

1/2	1,570	0.0020 - 0.0040

1. Coolant is not needed, however, make sure dust is efficiently collected.
2. Peck drilling is not needed if drilling depth is less than 3D.
3. The machinability of CFRP depends on physical makeup and percentage of contents, both speed & feed may need adjustments depending on material.
4. Feed rate can be and should be adjusted depending on surface layer makeup.
5. Feed rates can be increased when an approved coolant is utilized.
6. Please contact OSG for specific application questions.

1. Feed rates can and should be adjusted depending on stack makeup, with higher feed rates in the composite portion and lower feeds in the metal portion.
2. Peck drilling may be necessary for enhanced quality and proper chip evacuation.
3. There are many factors that can effect successful stack drilling; please contact OSG about your specific application for best recommendation.

"V" Grooving / Corner Chamfering (Milling)

Eccentric Pin Lock (Pat. Pend.)

Place insert over Eccentric Pin in loading position. Rotate pin **counter-clockwise**, with supplied allen wrench, to lock insert solidly against machined faces of tool holder.

Center Drilling & V-Grooving

Materials	RPM	IPM	Grade
Mild Steels	3,000	3.20	NK2020

12	-	1,700	0.0065-0.0075	1,700	0.0065-0.0075	1,280	0.0065-0.0075	130	0.0040-0.0050
-	1/2	1,600	0.0065-0.0075	1,600	0.0065-0.0075	1,200	0.0065-0.0075	120	0.0040-0.0050

The chart above is for materials typically used in aircraft structures. Speeds may be less than optimal because of limitations in the portable machine tools utilized.

*When using our List 233 three flute drills we recommend the same RPM but feed rates should be increased by 25-35%.

Hole Depth Diameters	Reduce Spindle Speed	Reduce Feed Rate
3 x Dia.	10%	10%
4 x Dia.	20%	10%
5 x Dia.	30%	20%
6 x Dia.	35%	20%
8 x Dia.	40%	20%

When drilling deep holes, the recommended speeds and feeds should be reduced proportionately based on the hole depth. To the left are guidelines for reducing the speeds and feeds.

1. The indicated speeds and feeds are when water soluble oil is used.
2. Suitable cutting fluid is water-emulsifiable, high density oil (less than 20 times dilution).
3. When using non-water soluble oil or water-emulsifiable oil (over 20 times dilution), reduce drilling speed by 20%.
4. Pecking is necessary when drilling depth of the hole exceeds 3 times drill diameter for lathe/horizontal machines.

D: Drill Diameter

Drilling Depth	≤4D	≤5D	≤6D
Coefficient for reducing RPM	x0.9	x0.8	x0.75

1. The indicated speeds and feeds are when water soluble oil is used.
2. Suitable cutting fluid is water-emulsifiable, high density oil (less than 10 times dilution).
3. With the exception of using milling chucks, pay careful attention to ensure that drill is rigidly clamped and keep deflection at a minimum.
4. In case of drilling depth: >4D, reduce drilling speed as below.
5. When using non-water soluble oil or water-emulsifiable oil (over 10 times dilution), reduce drilling speed by 20%.
6. Step process should be used when drilling depth of the hole exceeds 4 times drill diameter for vertical machines or 3 times drill diameter for horizontal lathe machines.

D: Drill Diameter

Drilling Depth	≤5D	≤6D
Coefficient for reducing RPM	x0.9	x0.7

1. Speeds and feeds are based on using soluble oil where applicable 1:5 to 1:10 concentration.
2. When other than an end mill collet is used, make sure the drill shank is firmly attached.
3. For deep holes (4 times the drill diameter or deeper) use the lower recommended feed rate as a starting point and increase as needed for the best result.
4. Recommended feeds and speeds are starting points only. Actual performance will be determined by specific material, the condition of equipment being used, and coolant.

1. The indicated speeds and feeds are for drilling with water soluble coolant.
2. The most suitable cutting fluid is water-emulsifiable high density oil (less than 10 times dilution)
3. When drilling cast surface (ie.not ground surface), reduce drilling speed by 20%.
4. For drilling depth>3D, reduce drilling speed (using the table below).
5. Step feeding is required for drilling depth>4D.
6. When using non-water soluble coolant or water-emulsifiable (over 10 times dilution), reduce the drilling speed by 20%.

D: Drill Diameter

Drilling Depth	≤4D	≤5D	≤6D
Coefficient for reducing RPM	x0.9	x0.8	x0.75

1. Speeds and feeds are based on using soluble oil where applicable 1:5 to 1:10 concentration.
2. When other than an end mill collet is used, make sure the drill shank is firmly attached.
3. For deep holes (4 times the drill diameter or deeper) use the lower recommended feed rate as a starting point and increase as needed for the best result.
4. Recommended feeds and speeds are starting points only. Actual performance will be determined by specific material, the condition of equipment being used, and coolant.

1. The indicated speeds and feeds are for drilling with water soluble oil.
2. When using non-water soluble oil, reduce the drilling speed by 20%.
3. When entering on a curved or inclined surface, reduce the feed rate accordingly.
4. When using a coated tool, the drilling speed can be increased by 1.2 times the value in the table.

Drill Reconditioning

OSG Tool Reconditioning

OSG's Bensenville facility is the special cutting tool and regrinding authority based in the Chicago area. Through accurate and expedient regrinds of high-end cutting tools, OSG helps customers extend tool life and save money by restoring their used cutting tools to their original condition. In addition to regrinding, the Bensenville facility also manufactures custom drills, reamers, and other special cutting tools, performs product modifications and provides premium coating services.

Before:

After:

As part of the OSG Corporation (headquartered in Japan), the regrind facility is the only OSG authorized regrinding source in America. The regrinding program uses the same OSG manufacturing drawings, adheres to OSG's strict quality control standards and uses the same equipment for OSG manufacturing and inspection procedures. As one of the world's leading cutting tool manufacturers, OSG offers a global network of support to our customers.

Tool Reconditioning Lowers Costs

The primary benefit of tool reconditioning is clear: the reduction in overall tooling costs. As part of normal production, tool wear, chipping and breakage occurs often affecting tool performance and increasing manufacturing costs. By reconditioning high performance drills, end mills and taps, OSG helps manufacturers realize substantial cost savings through extended tool life without jeopardizing production quality or performance. Because OSG's reconditioned tools are manufactured to the same high level of quality and held to the same exacting standards that new tools are, customers of OSG's tool reconditioning services can expect the same high performance and quality they are accustomed with OSG's new tools even after regrinding multiple times.

Engineering & Sales Support

OSG reconditions OSG tools using the same prints as the original tools made in our plants around the world. By using original part drawings, tools are accurately reconditioned to the original specifications, so customers are assured that reconditioned tools realize the same high level of performance. Manufacturers can also work directly with OSG design engineers to customize tools for enhanced performance or to meet specific requirements.

OSG's national sales team provides tooling expertise in the field for onsite evaluations and recommendations for manufacturers to implement a customized reconditioning program. The goal is to help manufacturers reduce tool costs and inventory, optimize performance and enhance overall profits.

Contact your OSG representative or distributor to review your tool reconditioning program.

CNC Training

OSG CNC technicians are extensively trained on proper setup methodologies and reconditioning processes by an on-staff CNC trainer. Through their development, the CNC Technician training program moves operators through three levels where they are diligently monitored and certified/reevaluated annually to maintain consistency and quality in our tools. Technicians are also trained and certified/reevaluated annually by Quality Assurance to perform inspections to print on first piece and in process tools.

Inspector Training

In order to guarantee that our tools are reconditioned to the highest standards, inspectors also undergo annual training and certifications which involve standardized procedures. These are the same methods that are used in the OSG manufacturing facilities in Japan and around the world. Inspectors are trained to inspect and measure tools completely to the original tool prints.

Throughout the reconditioning process, the tools are also continuously inspected until 100% visual inspection ensures that no chipped or defective tools are received by the customer. The high tech inspection equipment used at the reconditioning facility is the same equipment used at all OSG locations. This includes in-house developed tool analyzers and state-of-the-art equipment with up to 300x magnification capabilities. The key to inspecting high performance, accurate reconditioned tools is assuring that they are held to the same inspection standards through the use of the same inspection methods as new OSG tools.

The Bensenville plant is subject to OSG's stringent JQA regrinding standards and is certified regularly by OSG Japan.

Equipment and Facility

In 2015, OSG opened a reconditioning facility which is equipped with state-of-the-art production and inspection equipment. The facility uses high precision 5-Axis CNC grinders throughout the reconditioning process for improved repeatability and precision.

OSG's weekly equipment Preventive Maintenance (PM) program ensures consistency and accuracy throughout the reconditioning process. Through this PM program, OSG's tool reconditioning performance will be consistent year after year.

THREADING

The A Brand®

OSG's premium tooling brand. Features products that are designed to exceed the evolving manufacturing needs of our customers.

EXOPRO®

OSG's ultra-premium tooling series. Features supreme performance threading products with OSG's proprietary coatings for maximum cost-efficiency and productivity.

EXOCARB® Thread Mill

Premium sub-micrograin carbide thread mills suited for cast iron, steels, exotics and difficult-to-machine materials.

EXOCARB®

Ultra-high performance taps made from premium micrograin carbide used in automotive production, tapping hardened steels and threading the most abrasive of composite materials.

EXOTAP®

Ultra-premium taps made from VC-10 powdered metal high speed steel. EXOTAP® is the industry solution for difficult materials and applications, when no other tap seems to do the job.

HY-PRO®

Premium taps made from vanadium high speed steel and designed for a wide range of applications and industries.

HY-PRO® SEVEN

Semi-premium taps made from premium high speed steel for general purpose tapping applications.

GENERAL PURPOSE

Premium general purpose taps for general machining applications. Available in a variety of styles and coatings.

SOMTA

Value taps for a wide range of applications.

P	Carbon Steels (1010, 1018)			
	Mild Steels, Alloy Steels (1050, 4140)			
	Die Steels (H13, D2)			
M	Stainless Steel (304SS, 420SS)			
K	Cast Iron			
	Ductile Cast Iron			
N	Aluminum Alloys (6061, 7075)			
S	Heat Resistant Alloys (Inconel 718)			
	Titanium Alloy (Ti-6Al-4V)			
H	Pre-Hardened Steel (P20)			
	Die Cast Steels (A2, S7)			
	Hardened Steels (D2)			

Threading Application Guide

	Work Material	Material Designation	Material Condition	Hardness	
				BHN	HRC
P	Low Carbon Steel	1010, 1018	Normalized	~190	~10
	Medium Carbon Steel	1035, 1045	Normalized	~208	~15
	High Carbon Steel	1065, 1095	Normalized	~253	~25
	Alloy Steel	4140, 4340, 8620	Normalized	253~301	25~32
4140, 4340, 8620		Hardened	327~390	35~42	
M	Stainless Steel	300 Series / 400 Series	Annealed	~253	~25
		300 Series / 400 Series	Hardened	327~390	35~42
		17-4, 15-5, A286	Annealed	~253	~25
		17-4, 15-5, A286	Hardened	327~390	35~42
K	Cast Iron	Nodular, Grey	As Cast	~208	~15
N	Aluminum Alloy	6061, 7075, 2011	Normalized	~150	
	Die Cast Aluminum	356AL, 390AL	As Cast	~150	
S	Nickel Based Alloy	Inconel 718, 625	Annealed	253~301	25~32
		Inconel 718	Hardened	327~390	35~42
		Hastelloy, Waspaloy	Normalized		25~40
		Kovar	Normalized		25~40
	Titanium Alloy	6Al4V	Annealed	253~301	25~32
		6Al4V, 6Al6V	Hardened	327~390	35~42
H	Tool Steel	D2, H13, P20, S7	Annealed	190~253	10~25
		H13	Hardened	327~450	35~48
		D2, A2	Hardened		48~55
		D2, A2	Hardened		55~70

Since it is made to measure class 2B, it can also be used as is for 3B. If the internal thread is a blind hole, please confirm that the internal thread length is longer than the screw length of DCT75. The selection of the Height Master is required if the nominal diameter of the internal thread has a chamfer or counterbore over 1.5mm. Please consult with your local sales representative.

	D 16mm x L 30mm	9342051	

Please be sure to purchase the DCT75 and the Height Master as a set.

EXT

1. Hold the sleeve against the entrance of the internal thread. Please confirm the position of the sleeve and ensure that it is not in the way.
2. After confirming the shape of the internal thread, the sleeve's outer diameter and the hole diameter, please confirm the shape of the internal thread's entrance where the sleeve is fitted against.
3. The digital unit uses the Digimatic Indicator manufactured by Mitutoyo, paired with programs exclusively made for the DCT75.

Available V coating only.

Tapping Guidelines

1. Set tapping speed between 3 ~ 10 SFM.
2. Choose largest hole-size possible, within the recommended tolerance range.
3. Use a non-water soluble cutting fluid.
4. Use highly rigid machine and tool holders.
5. Tapping by hand is NOT recommended.
6. For tapping length over 1.5D, step feed is recommended.

Packed: 1 pc.
Available Nitride treatment only.

The H7 series are designed for tapping thermoplastic materials such as nylon and vinyl.

The 2B+ are designed for tapping thermosetting, reinforced plastics and laminated plastics such as epoxy, bakelite, fiberglass, etc. The 2B+ limit is based on the actual products limit and machining properties, taking the guess work out of H limit selection.

Oversize 2B+ Series = +.0005"~.001" over 2B thread limit.

OSG Metric Thread Plug Gages are manufactured to Class X tolerances per ANSI B1.16M (Metric M Series Screw Threads).
OSG Thread Gages are made from High Speed Steel (HSS) to 64 HRC.
Short Form Certificates of Conformance are available with gages for no charge.

***Long Form Certificates available upon request.**

THREADING

Technical

Tap and Screw Thread Terminology

Allowance: The minimum clearance or maximum interference which is intended between mating parts.

Angle of Thread: The angle included between the flanks of a thread measured in an axial plane.

Back Taper: A slight taper on the threaded portion of the tap, making the pitch diameter near the shank smaller than that at the chamfer.

Basic: The theoretical or nominal standard size from which all variations are made.

Chamfer: The tapered and relieved cutting teeth at the front end of the threaded section. Common types of chamfer are taper (8 to 10 threads long), plug (3 to 5 threads), semi (or modified) bottom (2.5 to 3 threads), and bottoming (1-1/2 threads).

Crest: The top surface joining the two sides or flanks of a thread.

Cutting Face: The leading side of the land.

Flute: The longitudinal channels formed on a tap to create cutting edges on the thread profile.

Heel: The following side of the land.

Height of Thread: In profile, distance between crest and bottom section of thread measured to the axis.

Hook Face: A concave cutting face of the land. This may be varied for different materials and conditions.

Interrupted Thread: Alternate teeth are removed in the thread helix on a tap having an odd number of flutes.

Land: Threaded sections between the flutes of a tap.

Lead of Thread: The distance a screw thread advances axially in one turn.

Major Diameter: The largest diameter of the screw or nut on a straight screw thread.

Minor Diameter: The smallest diameter of the screw or nut on a straight screw thread.

Neck: The reduced diameter, on some taps, between the threaded portion and the shank.

Pitch: The distance from a point on one thread to a corresponding point on the next thread, measured parallel to the axis of rotation.

Pitch Diameter: On a straight screw thread, the diameter of an imaginary cylinder where the width of the thread and the width of the space between threads is equal.

Point Diameter: The diameter at the leading end of the chamfered portion.

Rake Angle: The angle of the cutting face of the land in relation to an axial plane intersecting the cutting face at the major diameter.

Relief: The removal of metal behind the cutting edge to provide clearance between the part being threaded and a portion of the threaded land. Also, see back taper.

Chamfer Relief: The gradual decrease in land height from cutting edge to heel on the chamfered portion of the tap land to provide radial clearance for the cutting edge.

Con-eccentric Relief: Radial relief in the thread form starting back of a concentric margin.

Eccentric Thread Relief: Radial relief in the thread form starting at the cutting edge and continuing to the heel.

Root: The bottom surface joining the flanks of two adjacent threads.

Side or Flank Thread: The surface of the thread which connects the crest to the root.

Shank: The portion of the tap by which it is held.

Spiral Point: An oblique cutting edge ground into the lands to provide a shear cutting action on the first few threads.

Square: The squared end of the tap shank by which the tap is driven.

Thread: The helical formed portion of the tap which produces the pitch in a pre-existing hole.

Thread Lead Angle: The angle made by the helix of the thread at the pitch diameter, with a plane perpendicular to the axis.

Threads per Inch: The number of threads in one inch of length.

Thread:

Single: A thread in which lead is equal to pitch.

Double: A thread in which lead is equal to twice the pitch.

Triple: A thread in which lead is equal to triple the pitch.

Formulas

SFM (Surface Feet per Minute) = 0.262 x RPM x D

RPM (Revolutions Per Minute) = (3.82 x SFM) / D

Note: D = Diameter (Must be in inches)

ANSI General Tap Dimensions (USCTI Table 302)

These taps are oversize to the extent that the internal thread they produce will accommodate a helical coil screw thread insert, which, at final assembly, will accept a screw thread of the normal size and pitch.

LEAD TOLERANCE

A maximum lead deviation of plus or minus 0.0005" within any two threads not farther apart than one inch is permitted.

ANGLE TOLERANCE

6 to 9 threads per inch incl. = ±25' in 1/2 angle.
10 to 80 threads per inch incl. = ±30' in 1/2 angle.

FORMULA

Maximum major diameter = Basic +A.

Minimum major diameter = Basic +B.

For values of A and B see table 331.

PITCH DIAMETER LIMITS FOR TAPS THROUGH 1" DIAMETER

H1 Limit = Basic PD to basic PD + 0.0005".

H2 Limit = Basic PD + 0.0005" to Basic PD + 0.0010".

H3 Limit = Basic PD + 0.0010" to Basic PD + 0.0015".

H4 Limit = Basic PD + 0.0015" to Basic PD + 0.0020".

H5 Limit = Basic PD + 0.0020" to Basic PD + 0.0025".

H6 Limit = Basic PD + 0.0025" to Basic PD + 0.0030".

PITCH DIAMETER LIMITS FOR TAPS OVER 1" DIAMETER THROUGH 1-1/2" DIAMETER

H4 Limit = Basic PD + 0.0010" to Basic PD + 0.0020".

*Major diameter for H7 Limit Taps is 0.002" larger than values shown in min. and max. columns.

Fractional Size Taps – Ground Thread Unified and American National Form (USCTI Table 327)

Ground Thread Taps (USCTI Table 331)

The following tables and formula are used in determining the limits and tolerances for ground thread taps having a thread lead angle not in excess of 5°, unless otherwise specified.

LEAD TOLERANCE

A maximum lead deviation of $\pm 0.0005''$, within any two threads not farther apart than 1" is permitted.

ANGLE TOLERANCE

Threads Per Inch	Deviation in Half Angle
4 to 5-1/2 incl.	$\pm 20'$
6 to 9 incl.	$\pm 25'$
10 to 80 incl.	$\pm 30'$

FORMULA

Max. Major Dia. = Basic + A

Max. Pitch Dia. = Min. + D

Min. Major Dia. = Basic + B

Min. Pitch Dia. = Basic + C

In the above formula:

A = Constant to add = 0.130P for all Pitches

B = Major Diameter Tolerance = 0.087P for 48 Through 80 TPI
 = 0.076P for 36 Through 47 TPI
 = 0.065P for 4 Through 35 TPI

C = Amount over basic for minimum pitch diameter

D = Pitch diameter tolerance

Note: When the tap major diameter must be determined from a specified tap pitch diameter, the maximum major diameter equals the minimum specified pitch diameter minus Constant C, plus 0.64952P, plus Constant A.

LEAD TOLERANCE

A maximum lead deviation of ± 0.013 mm within any two threads not farther apart than 25 mm is permitted.

ANGLE TOLERANCE

Pitch (mm)	Deviation in Half Angle
Over 0.25 to 2.5 Incl.	$\pm 30'$
Over 2.5 to 4 Incl.	$\pm 25'$
Over 4 to 6 Incl.	$\pm 20''$

FORMULA

Min. Major Dia. = Basic + W	Max. Pitch Dia. = Basic + Y
Max. Major Dia. = Min. + X	Min. Pitch Dia. = Max. - Z
For Values of W, Y & Z, See Table 341	

In all cases, the tap major and pitch diameter inch conversions have been rounded upwards to the next ten thousandth of an inch. Basic values agree with B1 Report—ISO Metric Screw Threads, Table 9B.

OH Tap Limits

OH Limits for Taps with a pitch ≤ 0.6

OH Limits for Taps with a pitch ≥ 0.7

Ground Thread Tap Limits (USCTI Table 341)

The following tables and formula are used in determining the limits and tolerances for ground thread metric taps unless otherwise specified. They apply only to metric threads having a 60° form with a P/8 flat at the major diameter of the basic thread form.

LEAD TOLERANCE

A maximum lead deviation of ±0.013 mm within any two threads not farther apart than 25 mm is permitted.

ANGLE TOLERANCE

Pitch (mm)	Deviation in Half Angle
Over 0.25 to 2.5 incl.	±30'
Over 2.5 to 4. incl.	±25'
Over 4 to 6 incl.	±20'

FORMULA

Min. Major Dia = Basic + W	Max. Pitch Dia. = Basic + Y
Max. Major Dia. = Min. + X	Min. Pitch Dia. = Max. - Z

W = Constant to add to Basic Major Diameter*

X = Major Diameter Tolerance

Y = Amount over Basic for Maximum Pitch Diameter

Z = Pitch Diameter Tolerance

*W = .080P Converted to inches

Note: When the tap major diameter must be determined from a specified tap pitch diameter, the minimum major diameter equals the maximum specified tap pitch diameter minus constant Y, plus the basic single height of thread, plus constant W.

For intermediate pitches use value for next coarser pitch.

Symmetrical Thread Height; Equivalent to the basic height, h, of the original American National Form.

ISO TOLERANCE SYSTEM

The ISO Metric Screw Thread Tolerance System provides for tolerance grades and tolerance positions (allowances) for the pitch diameter and crest diameter.

TOLERANCE GRADES

A series of numbers, 3 through 9, were established as symbols, to reflect the size of the tolerance; the higher the number the larger the tolerance.

FOR EXTERNAL THREADS - (LOWER CASE LETTER SYMBOLS)

- Tolerance Position "e" has a large allowance. The upper limit is below basic by a large amount.
- Tolerance Position "g" has a small allowance. The upper limit is below basic by a small amount.
- Tolerance Position "h" has no allowance and the upper limit is basic.

FOR INTERNAL THREADS - (CAPITAL LETTER SYMBOLS)

- Tolerance Position "G" has a small allowance. The lower limit is above basic by a small amount.
- Tolerance Position "H" has no allowance and the lower limit is basic.

SELECTION OF TOLERANCE CLASSES

Two factors determine the selection of a suitable tolerance class:

1. Length of thread engagement (short, normal or long)
2. Quality requirement (fine, medium or coarse) See table below for preferred tolerance classes.

TOLERANCE POSITIONS

They define the maximum-material limits of the pitch and crest diameters and indicate their relationship to the basic profile. For plating requirements and ease of assembly, a series of tolerance positions were established.

PREFERRED TOLERANCE CLASSES

Quality Requirement	External Thread (Bolts)									Internal Thread (Nuts)					
	Tolerance Position e (Large Allowance)			Tolerance Position g (Small Allowance)			Tolerance Position h (No Allowance)			Tolerance Position G (Small Allowance)			Tolerance Position H (No Allowance)		
	Length of Thread Engagement			Length of Thread Engagement			Length of Thread Engagement			Length of Thread Engagement			Length of Thread Engagement		
	Short	Normal	Long	Short	Normal	Long	Short	Normal	Long	Short	Normal	Long	Short		
FINE Close Fit Applications							3h-4h	4h	5h-4h				4H		
MEDIUM General Purpose Applications		6e	7e-6e	5g-6g	6g	7g-6g	5h-6h	6h	7h-6h	5G	6G	7G	5H		
COARSE Difficult Manufacturing Applications					8g	9g-8g					7G	8G			

Tolerance Position "e" is not to be applied to pitches finer than 0.5 mm. Tolerance classes 6g and 6H are for commercial screw, bolt and nut threads.

THREAD DESIGNATIONS

Basic Designations: The letter "M" and the nominal size (basic major diameter in millimeters) followed by "X" and the pitch in millimeters, designates metric screw threads. For coarse series thread, the "X" and pitch may be omitted.

Example: Coarse series threads; M6
other threads; M8 x 1

A complete designation comprises, in addition to the basic designation, the tolerance class symbol separated by a dash. When the pitch and crest diameter tolerance classes are identical, the symbol need only be given once.

Example: M20 x 2—6H

When the pitch and crest diameters have different tolerance classes, the pitch diameter symbol is followed by the crest diameter symbol.

Example: M6 x 0.75—5g—6g

To indicate a specified thread fit between mating parts, the internal thread tolerance class symbol is followed by that of the external thread, separated by a slash.

Example: M20 x 2—6H/5g—6g

When rounded root external threads are to be specified, the minimum root radius value shall be added to the tolerance class designation.

Example: M6—5g—6g 0.100R

Limiting Dimensions of Standard Series Threads for Commercial Screws, Bolts and Nuts (Inches)

Nominal Size Diam	Pitch P	Basic Thread Designation	External Thread (Bolt)								Internal Thread (Nut)							
			Tol Cl.	Allowance	Major Diameter		Pitch Diameter			Minor Diameter		Tol Cl.	Minor Diameter		Pitch Diameter		Major Dia.	
					Max.	Min.	Max.	Min.	Tol.	Max.	Min.		Min.	Max.	Min.	Max.		Tol.

Excerpt from American National Standard B1. 16-1972, American Gaging Practices for Metric Screw Threads; "In all cases the inch conversion values have been rounded toward the interior of the tolerance zone, that is, maximum limits have been rounded downward and minimum limits have been rounded upward. Due to the fact that the majority of machinery and measuring equipment in the United States is based on the inch system, all gages should be made to the inch conversions."

TAP RECOMMENDATIONS: The pitch diameter high limits of the recommended tap for 6H tolerance class is 40% of the product tolerance rounded to the nearest .0005."

Example: M10 x 1.5; product tolerance = .00070" x .40 = .0028" rounded to .0030". This is the amount over basic pitch diameter. Based on .0005" increments over basic pitch diameter, the recommended tap has a D6 high limit (.0030 ÷ .0005").

Straight & Taper Pipe Taps

Standards & Dimensions

	Minor Dia.				

Minimum minor diameter flats are not specified. May be as sharp as practicable. Ground Thread Taps marked NPT may be used for NPT and ANPT applications.

LEAD TOLERANCE

A maximum lead deviation of ±.0005" within any two threads not farther apart than one inch is permitted.

FORMULA FOR AMERICAN NATIONAL STANDARD PIPE FORM

Minimum major diameter = Measured pitch diameter +A.
 Maximum major diameter = Measured pitch diameter +B.
 Minimum minor diameter = Measured pitch diameter -B.
 Maximum minor diameter = Measured pitch diameter -C.

FORMULA FOR DRYSEAL AMERICAN NATIONAL STANDARD PIPE FORM

Minimum major diameter = Measured pitch diameter +D.
 Maximum major diameter = Measured pitch diameter +E.
 Minimum minor diameter = Maximum or smaller.
 Maximum minor diameter = Measured pitch diameter -E.

LEAD TOLERANCE

A maximum lead deviation of plus or minus .0005" within any two threads not farther apart than one inch is permitted.

Note

Taps made to these specifications are marked NPS and used for NPS, NPSC, and NPSM.

Angle Tolerance

Threads Per Inch	Deviation in Half Angle
8	± 25'
11 1/2 to 27 Incl.	± 30'

Formula for American National Standard Dryseal Pipe Form (NPS)

The maximum Pitch Diameter of tap is based upon an allowance deducted from the maximum product pitch diameter of NPSC or NPSM, whichever is smaller. The minimum Pitch Diameter of tap is derived by subtracting the ground thread pitch diameter tolerance for actual equivalent size as shown in Table 331, page 433, Col. D.

Nominal Size (inch)	Major Diameter		Minor Diameter
	Min. G	Max. H	Max.

	Root		0.0069	0.0095	0.0080	0.0110

The major diameter of standard taper pipe plug gages and the minor diameter of standard taper pipe ring gages used for gaging dryseal threads will be truncated .20p minimum to .25p maximum for all pitches.

Tap Drill Sizes - Fractional Cut Taps

To minimize tapping problems and lengthen tool life, use the largest drill possible to produce a minor diameter that will result in the lowest percentage of full thread consistent with adequate strength. A minor diameter that provides a 55% to 65% thread is sufficient for most requirements, but in some cases a higher percentage of thread may be necessary to conform with the minor diameter limits of the thread class specified.

* Generally, deeper than 1-1/2 times the hole diameter.

Suggested Percentage of Full Thread in Tapped Holes

Material		*Deep Hole Tapping	Average Commercial Work	Thin Sheet Stock or Stamping
Free Cutting	Aluminum, Brass, Bronze, Cast Iron, Copper, Mild Steel, Tool Steel	60% - 70%	65% - 70%	75% - 85%
Hard or Tough Cutting	Cast Steel, Drop Forging, Monel Metal, Nickel Steel, Stainless Steel	55% - 65%	60% - 70%	

Tap Size	Threads Per Inch			Minor Diameter		Tap Drill Diameter - Cut Taps

FORMULA: TAP DRILL SIZE

$$\text{Drill Size} = \text{Tap Major Dia} - \frac{0.01299 \times \% \text{ of Full Thread}}{\# \text{ of Threads Per Inch}}$$

Example: to determine drill size for 1/4"-20 UNC tap, 70% thread

Tap Major $\phi = 0.2500"$
 % of Full Thread = 70%
 # of Threads per Inch = 20

$$\text{Drill Size} = 0.2500" - \frac{(0.01299 \times 70\%)}{20}$$

$$\text{Drill Size} = 0.2500" - 0.0455" = \boxed{0.2045"}$$

FORMULA: PERCENTAGE OF FULL THREAD

$$\% \text{ of Full Thread} = \text{Threads Per Inch} \times \frac{\text{Tap Major Dia} - \text{Drill Dia}}{0.01299}$$

Example: to determine the % of thread for 1/4"-20 UNC using 0.2045" drill

Threads per Inch = 20
 Tap Major $\phi = 0.2500"$
 Drill $\phi = 0.2045"$

$$\% \text{ of Thread} = 20 \times \frac{(0.2500 - 0.2045)}{0.01299}$$

$$\% \text{ of Thread} = 20 \times 3.50 = \boxed{70\%}$$

Tap Drill Sizes - Fractional Form Taps

To minimize tapping problems and lengthen tool life, use the largest drill possible to produce a minor diameter that will result in the lowest percentage of full thread consistent with adequate strength. A minor diameter that provides a 55% to 65% thread is sufficient for most requirements, but in some cases a higher percentage of thread may be necessary to conform with the minor diameter limits of the thread class specified.

* Generally, deeper than 1 1/2 times the hole diameter.

Suggested Percentage of Full Thread in Tapped Holes

Material		*Deep Hole Tapping	Average Commercial Work	Thin Sheet Stock or Stamping
Free Cutting	Aluminum, Brass, Bronze, Cast Iron, Copper, Mild Steel, Tool Steel	60% - 70%	65% - 70%	75% - 85%
Hard or Tough Cutting	Cast Steel, Drop Forging, Monel Metal, Nickel Steel, Stainless Steel	55% - 65%	60% - 70%

FORMULA: TAP DRILL SIZE

$$\text{Drill Size} = \text{Tap Major Dia} - \frac{\text{Pitch} \times \% \text{ of Full Thread}}{76.980}$$

Example: to determine drill size for M12 x 1.75 tap, 70% thread

$$\begin{aligned} \text{Tap Major } \varnothing &= 12\text{mm} \\ \% \text{ of Full Thread} &= 70\% \\ \text{Pitch} &= 1.75\text{mm} \\ \text{Drill Size} &= 12\text{mm} - \frac{(1.75 \times 70\%)}{76.980} \\ \text{Drill Size} &= 12\text{mm} - 1.591\text{mm} = \boxed{10.409\text{mm}} \end{aligned}$$

FORMULA: PERCENTAGE OF FULL THREAD

$$\% \text{ of Full Thread} = \text{Threads Per Inch} \times \frac{76.980}{\text{Pitch}}$$

Example: to determine the % of thread for M12 x 1.75 Tap using 10.41mm drill

$$\begin{aligned} \# \text{ Threads per Inch} &= 20 \\ \text{Tap Major } \varnothing &= 0.2500'' \\ \text{Drill } \varnothing &= 0.2045'' \\ \% \text{ of Thread} &= (12\text{mm} - 10.409\text{mm}) \times \frac{(0.2500 - 0.2262)}{0.0068} \\ \% \text{ of Thread} &= 1.591\text{mm} \times 43.989 = \boxed{70\%} \end{aligned}$$

Tap Drill Sizes - Metric Form Taps

To minimize tapping problems and lengthen tool life, use the largest drill possible to produce a minor diameter that will result in the lowest percentage of full thread consistent with adequate strength. A minor diameter that provides a 55% to 65% thread is sufficient for most requirements, but in some cases a higher percentage of thread may be necessary to conform with the minor diameter limits of the thread class specified.

* Generally, deeper than 1-1/2 times the hole diameter.

Suggested Percentage of Full Thread in Tapped Holes

Material		*Deep Hole Tapping	Average Commercial Work	Thin Sheet Stock or Stamping
Free Cutting	Aluminum, Brass, Bronze, Cast Iron, Copper, Mild Steel, Tool Steel	60% - 70%	65% - 70%	75% - 85%
Hard or Tough Cutting	Cast Steel, Drop Forging, Monel Metal, Nickel Steel, Stainless Steel	55% - 65%	60% - 70%	

Tap Size	Pitch		Minor Diameter (mm)		Tap Drill Diameter - Form Taps									
	M	MF	Min. 6H	Max. 6H	75% Thread		70% Thread		65% Thread		60% Thread		55% Thread

FORMULA: TAP DRILL SIZE		FORMULA: PERCENTAGE OF FULL THREAD	
Drill Size = Tap Major Dia - $\frac{\text{Pitch} \times \% \text{ of Full Thread}}{147.059}$		% of Full Thread = $\frac{(\text{Tap Major Dia} - \text{Drill Dia}) \times 147.059}{\text{Pitch}}$	
Example: to determine drill size for M12 x 1.75 tap, 70% thread		Example: to determine the % of thread for M12 x 1.75 Tap using 11.17mm drill	
Tap Major \varnothing = 12mm	Drill Size = 12mm - $\frac{(1.75 \times 70\%)}{147.059}$	# Threads per Inch = 20	% of Thread = $(12\text{mm} - 11.167\text{mm}) \times \frac{147.059}{1.75}$
% of Full Thread = 70%	Drill Size = 12mm - 0.833mm = 11.167mm	Tap Major \varnothing = 0.2500"	% of Thread = $(0.833\text{mm}) \times 84.03 = \b70\%$
Pitch = 1.75mm		Drill \varnothing = 0.2045"

The suggested drill sizes for aluminum listed in the table are within the minor diameter limits for STI tapped holes specified in MS 33537. Alternate drill sizes are suggested in many instances for magnesium, steel and plastics to provide for maximum tap wear life. In the case of magnesium, the larger size is recommended to allow for material close-in. There are suggested drill sizes and any special requirements or specifications will supersede these recommendations.

Tap Drill Sizes - STI Taps - Metric

Tap Size	Pitch	Minor Diameter (in) (After Tapping)		Tap Drill Diameter (Metric)	
		Min	Max	Aluminum	Steel, Magnesium, Plastic

The suggested drill sizes for aluminum listed in the table are within the minor diameter limits for STI tapped holes specified in MS 33537. Alternate drill sizes are suggested in many instances for magnesium, steel and plastics to provide for maximum tap wear life. In the case of magnesium, the larger size is recommended to allow for material close-in. There are suggested drill sizes and any special requirements or specifications will supersede these recommendations.

Machining Technique

OSG's A Brand® & EXOCARB® Thread Mills have been developed for thread milling on a 3-Axis CNC controlled machine tool. Threads are produced by advancing one pitch feed per revolution in the axial direction, utilizing the planet-like rotation and revolution movements of the tool. Internal and right/left hand threads can all be produced with this one tool by simply changing the direction of feed.

Threading Process

- 1-2 Move to edge (maintain clearance)
- 2-3 Cut with helical milling
- 3-4 Mill the circumference of the circle
- 4-5 Pull away from the edge
- 5-6 Remove tool

The transition between the start and finish of the milling operation must be smooth, and the appropriate amount of feed is essential for minimizing milling resistance. There are many different methods for using this tool, but our research has shown that this technique provides the most precise and efficient operation.

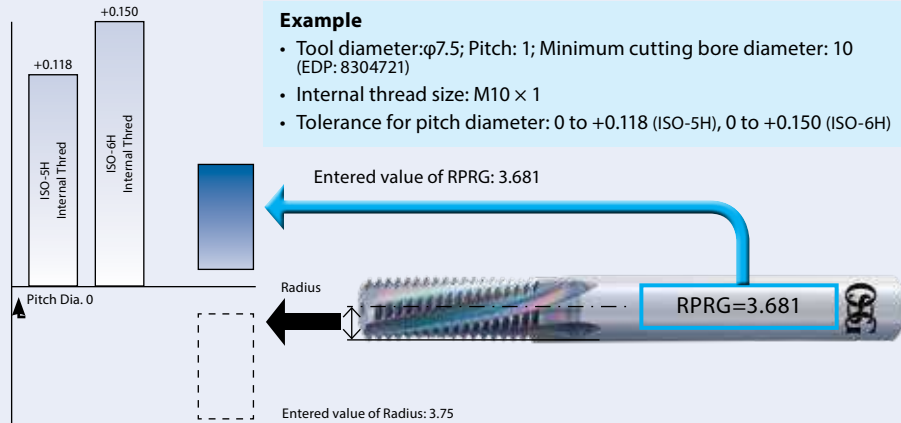

Thread Milling Process (view from above)

Radius Offset (RPRG)

RPRG is the reference value of tool radius offset.

Conventionally, the tool radius was entered during setup as a parameter of the NC system, which was corrected by checking the thread with a gauge. However, it has become possible to reduce the checking and correction simply by entering the RPRG value indicated on the tool shank.

NOTES:

1. RPRG are reference values. Determine optimal values after trial cutting as values depend on machining environment.
2. RPRG values are optimally established to achieve ISO:5H (formerly Grade 1) internal thread limits for metric threads and ANSI:3B internal thread limits for unified threads. RPRG values established for taper pipes (R/Rc) are effective when using the thread milling NC code generator software ThreadPro available on our website.
3. For diameters of thread mills, RPRG values are calculated based on the minimum cutting bore diameter (the minimum cutting internal thread size of the tool diameter). To cut other diameters, it is necessary to use a smaller value than RPRG.

ThreadPro (Thread Milling NC Code Generator Software)

www.osgtool.com/threadpro

- Available in 12 different languages
- Supports 8 NC programming languages
- Incorporates RPRG* value to further simplify process

* RPRG = reference value of tool radius offset

1. The indicated speeds and feeds are for water-soluble coolant.
2. Water-soluble coolant is not suitable for threading magnesium alloy.
3. Please adjust the cutting conditions depending on the rigidity of the machine, tool holders, and workpiece clamping.
4. If the threading length is long, or when machining a large-pitch thread, reduce the feed rate and take multiple passes.
5. If a machined parallel internal thread is tapered and prevents the go-gauge from going through, add a zero cut/spring pass.

For chip loads, the smaller cutter diameters use a smaller chip load per tooth within a given range. Larger cutter diameters use the larger chip load per tooth within the given range. For programming help or other information, please contact our Engineering Department at 800-837-2223.

PROBLEM	CAUSE	SOLUTION
Chip Packing (Back Threaded Portion) 	Inappropriate spindle speed	Adjust RPM (lower or higher) for proper chip form
	Helix angle too large	Decrease helix angle or choose tap with low helix angle
	Chips not coiling / breaking properly	Use alternate coating
Chip Packing (Single Thread) 	*Occurs predominantly in horizontal applications*	
	Weak rake angle (positive)	Decrease rake angle
	Chips not evacuating properly	Use a POT style tap or a LHH / RHF
Chipping During Reversal 	Chips left behind in flute during tap reversal	Improve wear resistance of tap
		Improve / add surface treatment / coating
	Material shrinkage	Increase coolant volume / concentration to control heat
Chipping Due to Wear 	Tap substrate not suitable for work material	Improve wear resistance of tap
		Improve / add surface treatment / coating
	Cutting action work hardened material	Shorten chamfer length
Chipping of Land Edge 	Occurs when tap either hits bottom or entrance of hole	Avoid hitting the bottom of the hole, check stroke length, alignment and hole size
Chipping of Land Axially 	Occurs when tap either hits bottom or entrance of hole	Avoid hitting the bottom of the hole, check stroke length, alignment and hole size
Chipping of Chamfer 	Tap substrate not suitable for work material	Improve wear resistance of tap
	Inappropriate pre-drill size	Select suitable pre-drill size

PROBLEM	CAUSE	SOLUTION
Premature Tap Wear 	Inappropriate spindle speed	Reduce spindle speed
	Possible work hardening of pre-drilled hole	Prevent work hardening of pre-drilled hole
	Inappropriate thread relief	Use proper thread relief
	Inappropriate chamfer length	Adjust chamfer length
	Inappropriate lubrication	Change coolant method Increase volume / concentration Apply surface coating / treatment
Welding / Galling 	Inappropriate spindle speed	Reduce spindle speed
	Inappropriate lubrication	Change coolant method Increase volume / concentration Apply surface coating / treatment
Deformed Lobes 	Possible work hardening of pre-drilled hole	Prevent work hardening of pre-drilled hole
	Inappropriate spindle speed	Reduce spindle speed
	Inappropriate pre-drill size	Increase pre-drill hole size as much as possible
	Inappropriate lubrication	Change coolant method Increase volume / concentration Apply surface coating / treatment
		Tap substrate not suitable for material
Tap Breakage 	Possible chip packing	Avoid chip packing
	Inappropriate pre-drill size	Increase pre-drill hole size as much as possible
	Inappropriate spindle speed	Reduce spindle speed
	Possible runout or tapered hole	Reduce runout and assure hole is straight
	Too high of torque generated	Use tap holder with torque adjustment / limiting feature
	Possible tap collision with bottom of hole	Avoid hitting the bottom of the hole, check stroke length, alignment and hole size
Overcutting / Oversized Threads 	Inconsistent feed of spiral fluted style tap	Use compensating tension / compression tap holder Adjust feed rate appropriately Check CNC program
		Inconsistent feed of spiral pointed style tap
Tearing on Flanks 	Inappropriate thread relief / rake angle	Use sharper / freer cutting relief and angle
	Inappropriate lubrication	Change coolant method Increase volume / concentration Apply surface coating / treatment
Extremely Torn Threads 	Possible welding / galling	Select appropriate cutting conditions
	Possible chip packing	Select appropriate cutting conditions
	Inappropriate thread relief	Use sharper thread relief Change coolant method Increase volume / concentration Apply surface coating / treatment
		Inappropriate lubrication
Chips Remain at Bottom 	Inappropriate geometry of tap	Reduce chamfer relief angle
		Use thinner land width
		Reduce chamfer length
		Reduce cutting angle

MILLING

MILLING

The A Brand®

OSG's premium tooling brand. Features products that are designed to exceed the evolving manufacturing needs of our customers.

EXOPRO®

OSG's ultra-premium tooling series, featuring our latest innovative technologies when the absolute best performance is needed.

EXOCARB® WXL®

The new standard in high performance end mills for high speed machining, featuring our WXL™ nanocoating technology.

EXOCARB® WXS®

The new standard in high performance end mills for hard milling, featuring our WXS™ nanocoating technology.

EXOCARB® MAX

Maximum performance end mills designed exclusively for hard milling. Features technologies including WXS™ and CBN.

EXOCARB® DIAMOND

OSG's patented CVD diamond coated end mills for die/mold and aerospace applications in non-ferrous materials like graphite, aluminum and CFRP.

EXOCARB® AERO

High performance carbide end mills for aircraft materials.

HY-PRO® CARB

Performance sub-micrograin carbide end mills with OSG TiAlN coating. The perfect blend of performance and cost-efficiency.

CARBIDE

All-purpose micrograin carbide end mills for general machining applications.

SOMTA

Value carbide and HSS-cobalt and mills for a wide range of applications.
