- * The tool may deflect and interfere with the draft area depending on the milling condition.
- * For convenience, the Neck Draft Angle (β°) is shown the same as the Effective Draft Angle (α°), but actually it is different. (It does not interfere with the Effective Draft Angle (α°))

HY-PRO® V ADVANTAGE

HY-PRO® V End Mills are made from premium HSSE-V3 (3% Vanadium) high speed steel for increased toughness and tool life. Available with TiCN coating for increased wear resistance when machining abrasive materials. With no cobalt content, HY-PRO® V End Mills are environmentally safe when reground.

Styles of Cut

Medium Tough Cut

Engineered specifically for tough applications. Tough cut insures faster, splinter-free cutting in weld and alloy castings with increased tool life.

Medium Right Hand Spiral

General purpose - Recommended for stock removal and a smooth finish.

Aluminum Cut

Designed for use on aluminum, non-ferrous metals, soft steel, reinforced plastics, and other soft materials.

Recommended Cutting Speeds for Carbide Burs

Diameter	RPM	Maximum RPM
1/16"	55,000 - 85,000	90,000
3/32"	50,000 - 60,000	85,000
1/8"	35,000 - 65,000	80,000
3/16"	30,000 - 55,000	75,000
1/4"	25,000 - 50,000	70,000
5/16"	18,000 - 38,000	65,000
3/8"	17,000 - 38,000	63,000
7/16"	13,000 - 37,000	55,000
1/2"	14,000 - 36,000	50,000
5/8"	11,000 - 23,000	40,000
3/4"	8,000 - 19,000	30,000
1"	7,000 - 18,000	25,000

NOTE: Use lower speeds when cutting harder ferrous materials and higher speeds for softer non-ferrous materials.

Coarse and Fine Cuts are available on request.

	883-6250-60	SF-6MA	16	25
	883-7500-60	SF-14MA	19	32

Aluminum cut burs are designed for use on:

- Aluminum
- Non-ferrous metals
- Soft Steel
- Reinforced plastics
- Other soft materials

Also provide excellent work finish with minimum loading when cutting soft, sticky materials.

*Indicates 1/4" brazed carbide shank 2" OAL; all others have 1/4" diameter hardened steel shank (3/8" diameter shanks available).

*Indicates 6mm brazed carbide shank 50mm OAL; all others have 6mm diameter hardened steel shank (9mm diameter shanks available).

1/4" Shank (For Aluminum)

6mm Shank (For Aluminum)

1. The above milling condition is a guideline for overhang length 3D.
2. Use a rigid and precise machine and holder.
3. Please use a suitable fluid with high smoke retardant properties.
4. During dry (no fluid) milling, please use air blow to remove chips from the milling area and to eliminate chip packing.
5. Please use water-soluble coolant when machining stainless steel.
6. Reduce speed and feed as well as depth of cut when high precision is required.
7. Adjust the speed and feed accordingly when the overhang length is longer than specified.

1. Use a rigid and precise machine and holder.
2. Please use a suitable fluid with high smoke retardant properties.
3. During dry (no fluid) milling, please use air blow to remove chips from the milling area and to eliminate chip packing.
4. Please use water-soluble coolant when machining stainless steel.
5. Reduce speed and feed as well as depth of cut when high precision is required.

- The above mentioned conditions according to projection lengths are intended as general guidelines for reference only. Adjustments should be made based on actual milling conditions.
- For 0.5R - 2.5R, the machining conditions are based on chucking the tool up to the base of the neck.
- Highly rigid machines and tool holders should be used.
- Tool vibrations should be kept at a minimum level for maximum accuracy.
- In the case of linear machining, do not use the Ar value, instead refer to the Aa value.
- More stable high-feed machining in the corners can be attained by setting an R insertion or deceleration on the CAM or machine side.
- When cutting load fluctuates (in the corners, etc.) or when high-precision is required, be sure to control the rotational speed.
- When cutting at greater than the recommended cutting angle, reduce the feed.

- The above mentioned conditions according to projection lengths are intended as general guidelines for reference only. Adjustments should be made based on actual milling conditions.
- For 0.5R - 2.5R, the machining conditions are based on chucking the tool up to the base of the neck.
- Highly rigid machines and tool holders should be used.
- Tool vibrations should be kept at a minimum level for maximum accuracy.
- In the case of linear machining, do not use the Ar value, instead refer to the Aa value.
- More stable high-feed machining in the corners can be attained by setting an R insertion or deceleration on the CAM or machine side.
- When cutting load fluctuates (in the corners, etc.) or when high-precision is required, be sure to control the rotational speed.
- When cutting at greater than the recommended cutting angle, reduce the feed.

List 9570 - EXOPRO[®] PHX: High Feed, Corner Radius

List 9575 - EXOPRO[®] PHX: Deep Feed, Corner Radius

List 9576 - EXOPRO[®] PHX: Long Neck, Deep Feed, Corner Radius

List 9580 - EXOPRO[®] PHX: Pencil Neck, Deep Feed, Corner Radius

1. The above mentioned conditions according to projection lengths are intended as general guidelines for reference only. Adjustments should be made based on actual milling conditions.
2. Highly rigid machines and tool holders should be used.
3. Tool vibrations should be kept at a minimum level for maximum accuracy.
4. In the case of linear machining, do not use the Ar value, instead refer to the Aa value.
5. Under general machining conditions, air-blow cutting method is recommended.
6. More stable high-feed machining in the corners can be attained by setting an R insertion or deceleration on the CAM or machine side.
7. When cutting load fluctuates (in the corners, etc.) or when high-precision is required, be sure to control the rotational speed.
8. When cutting at greater than the recommended cutting angle, reduce the feed.
9. When the depth of cut is less than the specified amount as listed above, the feed rate can be increased up to 150%.
10. When the depth of cut is greater than the specified amount as listed above, the feed rate can be reduced by no more than 60% to ensure stable milling.

1. Adjust the speed, feed, and plunge depth in accordance with operating conditions, including the machining shape, machine rigidity, holder rigidity, and work holding force.
2. If the speed and feed rates cannot increase due to equipment performance, operate by reducing the speed and feed rates at the same ratio.
3. High cutting speeds and feed rates can cause cutter wear or reduce machining precision. Therefore, operate by reducing the feed rate as needed.
4. Depending on the shape to be machined, if the end mill chatters during machining, it can bite into the shape. Therefore, operate by reducing the speed and feed rates at the same ratio.
5. For precise, detailed machining, use a dedicated machine that operates quietly.
6. Operate by keeping the runout at the tip of the end mill below 5 microns (.0002").
7. To perform finish machining with a high level of efficiency, keep the speed and feed rates below 2 times.
8. To finish a flat surface, operate at a speed range with a minimal amount of equipment vibration, making sure that the feed rate does not cause the equipment to wobble.
9. To finish machine a curved surface using the corner radius tool, operate by changing the machining pitch.
10. Set the inclined cut angle approximately between 0.3° and 0.5°.

For Standard LDR (Up to 6:1)

1. The indicated speeds and feeds are for high speed light milling for use with high speed/high precision machining centers.
2. Do not use flammable fluids because tools with considerable wear can cause sparks.
3. We recommend using air blow. When using cutting fluids, use a high quality fluid with high smoke retardant.

1. The indicated speeds and feeds are for high speed light milling for use with high speed/high precision machining centers.
2. Do not use flammable fluids because tools with considerable wear can cause sparks.
3. We recommend using air blow. When using cutting fluids, use a high quality fluid with high smoke retardant.

1. Use a rigid and precise machine and holder.
2. When chattering occurs, reduce the speed and feed simultaneously.
3. Use a suitable cutting fluid with high smoke retardant.

1. Use a rigid and precise machine and holder.
2. When chattering occurs, reduce the speed and feed simultaneously.
3. Use a suitable cutting fluid with high smoke retardant.

1. Use a rigid and precise machine and holder.
2. When chattering occurs, reduce the speed and feed simultaneously.
3. Use a suitable cutting fluid with high smoke retardant.

1. Use a rigid and precise machine and holder.
2. When chattering occurs, reduce the speed and feed simultaneously.
3. Use a suitable cutting fluid with high smoke retardant.

1. Use a rigid and precise machine and holder.
2. When chattering occurs, reduce the speed and feed simultaneously.
3. Use a suitable cutting fluid with high smoke retardant.

1. Use a rigid and precise machine and holder.
2. When chattering occurs, reduce the speed and feed simultaneously,
3. Use a suitable cutting fluid with high smoke retardant.

1. Use a rigid and precise machine and holder.
2. Use a suitable cutting fluid with high smoke retardant.
3. When the length of tool extension from the machine is long, reduce the speed and feed.

1. Use a rigid and precise machine and holder.
 2. When chattering occurs, reduce the speed and feed simultaneously.
 3. Use a suitable cutting fluid with high smoke retardant.
- * Maximum speed will vary by diameter.

1. Use a rigid and precise machine and holder.
 2. When chattering occurs, reduce the speed and feed simultaneously.
 3. Use a suitable cutting fluid with high smoke retardant.
- * Maximum speed will vary by diameter.

1. Use a rigid and precise machine and holder.
2. When chattering occurs, reduce the speed and feed simultaneously.
3. Use a suitable cutting fluid with high smoke retardant.

1. Use a rigid and precise machine and holder.
2. When chattering occurs, reduce the speed and feed simultaneously.
3. Use a suitable cutting fluid with high smoke retardant.

1. Use a rigid and precise machine and holder.
2. When chattering occurs, reduce the speed and feed simultaneously.
3. Use a suitable cutting fluid with high smoke retardant.

1. Use a rigid and precise machine and holder.
2. When chattering occurs, reduce the speed and feed simultaneously.
3. Use a suitable cutting fluid with high smoke retardant.

1. Use a rigid and precise machine and holder.
2. When chattering occurs, reduce the speed and feed simultaneously.
3. Use a suitable cutting fluid with high smoke retardant.

1. Use a rigid and precise machine and holder.
2. When chattering occurs, reduce the speed and feed simultaneously.
3. Use a suitable cutting fluid with high smoke retardant.

1. Use a rigid and precise machine and holder.
2. Use a suitable cutting fluid with high smoke retardant.
3. When the length of tool extension from the machine is long, reduce the speed and feed.

1. Use a rigid and precise machine and holder.
2. When chattering occurs, reduce the speed and feed simultaneously.
3. Use a suitable cutting fluid with high smoke retardant.

1. Use a rigid and precise machine and holder.
2. When chattering occurs, reduce the speed and feed simultaneously.
3. Use a suitable cutting fluid with high smoke retardant.

1. Use a rigid and precise machine and holder.
2. We suggest using an air blow. If using cutting fluids, use a high quality fluid with smoke retardant.
3. When the length of tool extension from the machine is long, reduce the speed and feed.

1. The indicated speeds and feeds are for high speed light milling for use with high speed/high precision machining centers.
2. Do not use flammable fluids because tools with considerable wear can cause sparks.
3. We recommend using air blow. When using cutting fluids, use a high quality fluid with high smoke retardant.

1. Use a rigid and precise machine and holder.
2. These milling conditions are based on milling with circular interpolation at corners; for milling without circular interpolation (such as right angle cornering), reduce the speed to 50-70% and the cutting depth to 50-80% of the above conditions.
3. We recommend using air blow or MQL (mist).
4. Please adjust the speed, feed and cutting depth according to actual cutting conditions.
5. When entering into the part, reduce the feed to 30-60% of the above conditions, with a ramping angle < 2°.
6. These milling conditions are for a tool overhang less than 4xD; for longer overhangs, reduce the speed, feed and cutting depth to prevent chattering.

1. Use a rigid and precise machine and holder.
2. When chattering occurs, reduce the speed and feed simultaneously.
3. Use a suitable cutting fluid with high smoke retardant.

1. To achieve flute depth, sequential use of each neck length is most effective.
2. When corner processing, reduce the feed rate by approximately half.
3. Use cutting fluid.

1. Use a rigid and precise machine and holder.
2. We suggest using an air blow. If using cutting fluids, use a high quality fluid with smoke retardant.
3. When the length of tool extension from the machine is long, reduce the speed and feed.

1. Use a rigid and precise machine and holder.
2. We suggest using air blow or MQL (mist).
3. When using low speed machines, use the maximum speed and adjust feed rate.
4. During heavy load operations such as corner processing, reduce the speed and feed.
5. The run out of the end mill should be within 10 microns (.0004") after chucking.

1. Use a rigid and precise machine and holder.
2. We suggest using air blow or MQL (mist).
3. When using low speed machines, use the maximum speed and adjust feed rate.
4. During heavy load operations such as corner processing, reduce the speed and feed.
5. The run out of the end mill should be within 10 microns (.0004") after chucking.

1. Use a rigid and precise machine and holder.
2. When chattering occurs, reduce the speed and feed simultaneously.
3. Use a suitable cutting fluid with high smoke retardant.

3/8	3,000 - 6,100	0.009 - 0.012
1/2	2,300 - 4,600	0.012 - 0.020

1. The conditions listed above are based on approximately 1xDc thickness of part with rigid work holding.
2. Conventional cut is recommended at part side for good surface finish.
3. Milling speed can be increased by 20-50% with the use of appropriate cutting oil.
4. Please provide appropriate measures against dust (Such as vacuum dust collection).
5. Depending on the workpiece thickness and form as well as work holding, vibration may occur. When it occurs, please adjust RPM and feed rate.

Feed Reduction

Material Thickness	Feed Reduction

1. Reduce speeds & feeds 20-30% for Series 464.
2. Reduce speeds & feeds 40-50% for Series 484.
3. Slotting is not recommended for Series 484.
4. Increase speeds & feeds 20-30 % for Series 404 TiN.
5. Column for Hardened Steels (40-50 HRC), is for Series 404 TiN only.

1. Increase speeds & feeds 5-10% for Series 412BN, 414BN, 442BN and 444BN.
2. Reduce speeds & feeds 20-30% for Series 462BN and 464BN.
3. Reduce speeds & feeds 40-50% for Series 482BN and 484BN.
4. Increase speeds & feeds 20-30% for Series 402BN TiN and 404BN TiN.
5. Column for Hardened Steels (40-50 HRC) is for 402BN TiN and 404BN TiN only.

Reconditioning

OSG Tool Reconditioning

OSG's Bensenville facility is the special cutting tool and regrinding authority based in the Chicago area. Through accurate and expedient regrinds of high-end cutting tools, OSG helps customers extend tool life and save money by restoring their used cutting tools to their original condition. In addition to regrinding, the Bensenville facility also manufactures custom drills, reamers, and other special cutting tools, performs product modifications and provides premium coating services.

Before:

After:

As part of the OSG Corporation (headquartered in Japan), the regrind facility is the only OSG authorized regrinding source in America. The regrinding program uses the same OSG manufacturing drawings, adheres to OSG's strict quality control standards and uses the same equipment for OSG manufacturing and inspection procedures. As one of the world's leading cutting tool manufacturers, OSG offers a global network of support to our customers.

Tool Reconditioning Lowers Costs

The primary benefit of tool reconditioning is clear: the reduction in overall tooling costs. As part of normal production, tool wear, chipping and breakage occurs often affecting tool performance and increasing manufacturing costs. By reconditioning high performance drills, end mills and taps, OSG helps manufacturers realize substantial cost savings through extended tool life without jeopardizing production quality or performance. Because OSG's reconditioned tools are manufactured to the same high level of quality and held to the same exacting standards that new tools are, customers of OSG's tool reconditioning services can expect the same high performance and quality they are accustomed with OSG's new tools even after regrinding multiple times.

Engineering & Sales Support

OSG reconditions OSG tools using the same prints as the original tools made in our plants around the world. By using original part drawings, tools are accurately reconditioned to the original specifications, so customers are assured that reconditioned tools realize the same high level of performance. Manufacturers can also work directly with OSG design engineers to customize tools for enhanced performance or to meet specific requirements.

OSG's national sales team provides tooling expertise in the field for onsite evaluations and recommendations for manufacturers to implement a customized reconditioning program. The goal is to help manufacturers reduce tool costs and inventory, optimize performance and enhance overall profits.

Contact your OSG representative or distributor to review your tool reconditioning program.

CNC Training

OSG CNC technicians are extensively trained on proper setup methodologies and reconditioning processes by an on-staff CNC trainer. Through their development, the CNC technician training program moves operators through three levels where they are diligently monitored and certified/reevaluated annually to maintain consistency and quality in our tools. Technicians are also trained and certified/reevaluated annually by Quality Assurance to perform inspections to print on first piece and in process tools.

Inspector Training

In order to guarantee that our tools are reconditioned to the highest standards, inspectors also undergo annual training and certifications which involve standardized procedures. These are the same methods that are used in the OSG manufacturing facilities in Japan and around the world. Inspectors are trained to inspect and measure tools completely to the original tool prints.

Throughout the reconditioning process, the tools are also continuously inspected until 100% visual inspection ensures that no chipped or defective tools are received by the customer. The high tech inspection equipment used at the reconditioning facility is the same equipment used at all OSG locations. This includes in-house developed tool analyzers and state-of-the-art equipment with up to 300x magnification capabilities. The key to inspecting high performance, accurate reconditioned tools is assuring that they are held to the same inspection standards through the use of the same inspection methods as new OSG tools.

The Bensenville plant is subject to OSG's stringent JQA regrinding standards and is certified regularly by OSG Japan.

Equipment and Facility

In 2015, OSG opened a reconditioning facility which is equipped with state-of-the-art production and inspection equipment. The facility uses high precision 5-Axis CNC grinders throughout the reconditioning process for improved repeatability and precision.

OSG's weekly equipment Preventive Maintenance (PM) program ensures consistency and accuracy throughout the reconditioning process. Through this PM program, OSG's tool reconditioning performance will be consistent year after year.

INDEXABLE

OSG **PHOENIX**[®]

OSG's high performance indexable tooling for rough and finish milling and drilling in a variety of applications.

EXOCARB[®] ***DISC CUTTER S***

OSG's patented face mill for high feed, roughing applications on low horsepower machine spindles.

EXOCARB[®] ***DISC CUTTER PRO***

OSG's patented face mill for high feed, finishing applications on low horsepower machine spindles.

Material Class	Grade	Coating Method	Hardness (HRA)	Surface Treatment		Features
				Main Component	Coating Thickness	
P	XC3020	CVD	90.5	TiCN + Al ₂ O ₃	10 µm	For Machining Steel and Cast Iron Composed of a tough, high-strength carbide material with a chipping-resistant and wear-resistance coating.
	XP3025	PVD	90.5	TiAlN	5 µm	For Machining Steel and Cast Iron Composed of a tough, high-strength carbide material with a chipping-resistant and wear-resistance coating.
	XC3025	CVD	90.8	TiCN + TiN + Al ₂ O ₃	4 µm	For Machining Steel, Stainless Steel and Cast Iron Composed of a tough, high-strength carbide material with a chipping-resistant and wear-resistant coating.
	XC3030	CVD	89.5	TiCN + Al ₂ O ₃	10 µm	For Machining Steel and Cast Iron Composed of a tough, high-strength carbide material with a chipping-resistant and wear-resistant coating.
	XP3035	PVD	89.5	TiAlN	5 µm	For Machining Steel, Stainless Steel and Cast Iron A grade for general purpose milling. Composed of a tough, high-strength carbide material with a chipping-resistant and wear-resistant coating.
	XP3930	PVD	90.8	TiAlN	3 µm	For Machining Steel, Stainless Steel and Cast Iron Excellent balance; can accommodate a wide range of workpiece materials.
	XP8030	PVD	91.9	TiAlN	3 µm	For Machining Steel & Stainless Steel Excellent balance of wear-resistance and chipping-resistance; can accommodate a wide range of workpiece materials.
	XC8035	CVD	89.6	TiCN + Al ₂ O ₃	7 µm	For Machining Steel and Cast Iron Composed of a tough, high-strength carbide material with a chipping-resistant and wear-resistant coating.
	XP3225	PVD	91.5	Cr	3 µm	For Machining Steel, Stainless Steel and Cast Iron Composed of a tough carbide material with an excellent general purpose coating.
	XP3310	PVD	92.5	SiC Silicon-based heat-resistant coating	3 µm	For Machining Steel and Cast Iron Composed of a tough, high-strength carbide material with a chipping-resistant and wear-resistant coating.
	XP3320	PVD	91.5	SiC Silicon-based heat-resistant coating	3 µm	For Machining Steel, Stainless Steel and Cast Iron Composed of a tough carbide material with a heat-resistant and wear-resistant coating.
	XP3425	PVD	91.8	Cr Composite multilayer	7 µm	For Drilling Steel Composed of a tough, high strength carbide material with a wear-resistant thick film coating.
	XC9015	CVD	91.9	TiCN + Al ₂ O ₃	7 µm	For Drilling Steel Composed of a tough carbide material with an anti-chipping and wear-resistant coating.
	XP9020	PVD	91.9	TiAlN	3 µm	For Drilling Steel, Stainless Steel, Cast Iron and Non-Ferrous Materials Composed of a tough carbide material with an anti-chipping and wear-resistant coating.
	XP9040	PVD	91.9	TiAlN	3 µm	For Drilling Steel and Stainless Steel Composed of a high-strength carbide material with an anti-chipping and wear-resistant coating.

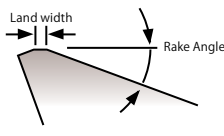

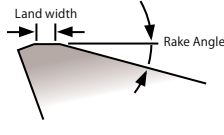

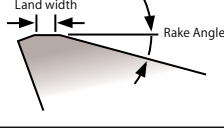

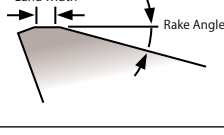

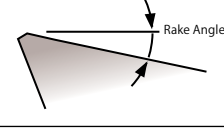

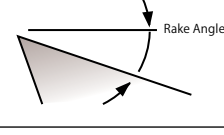

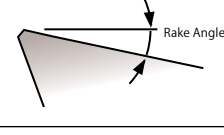

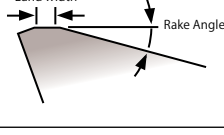

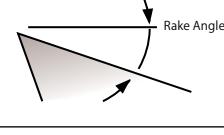

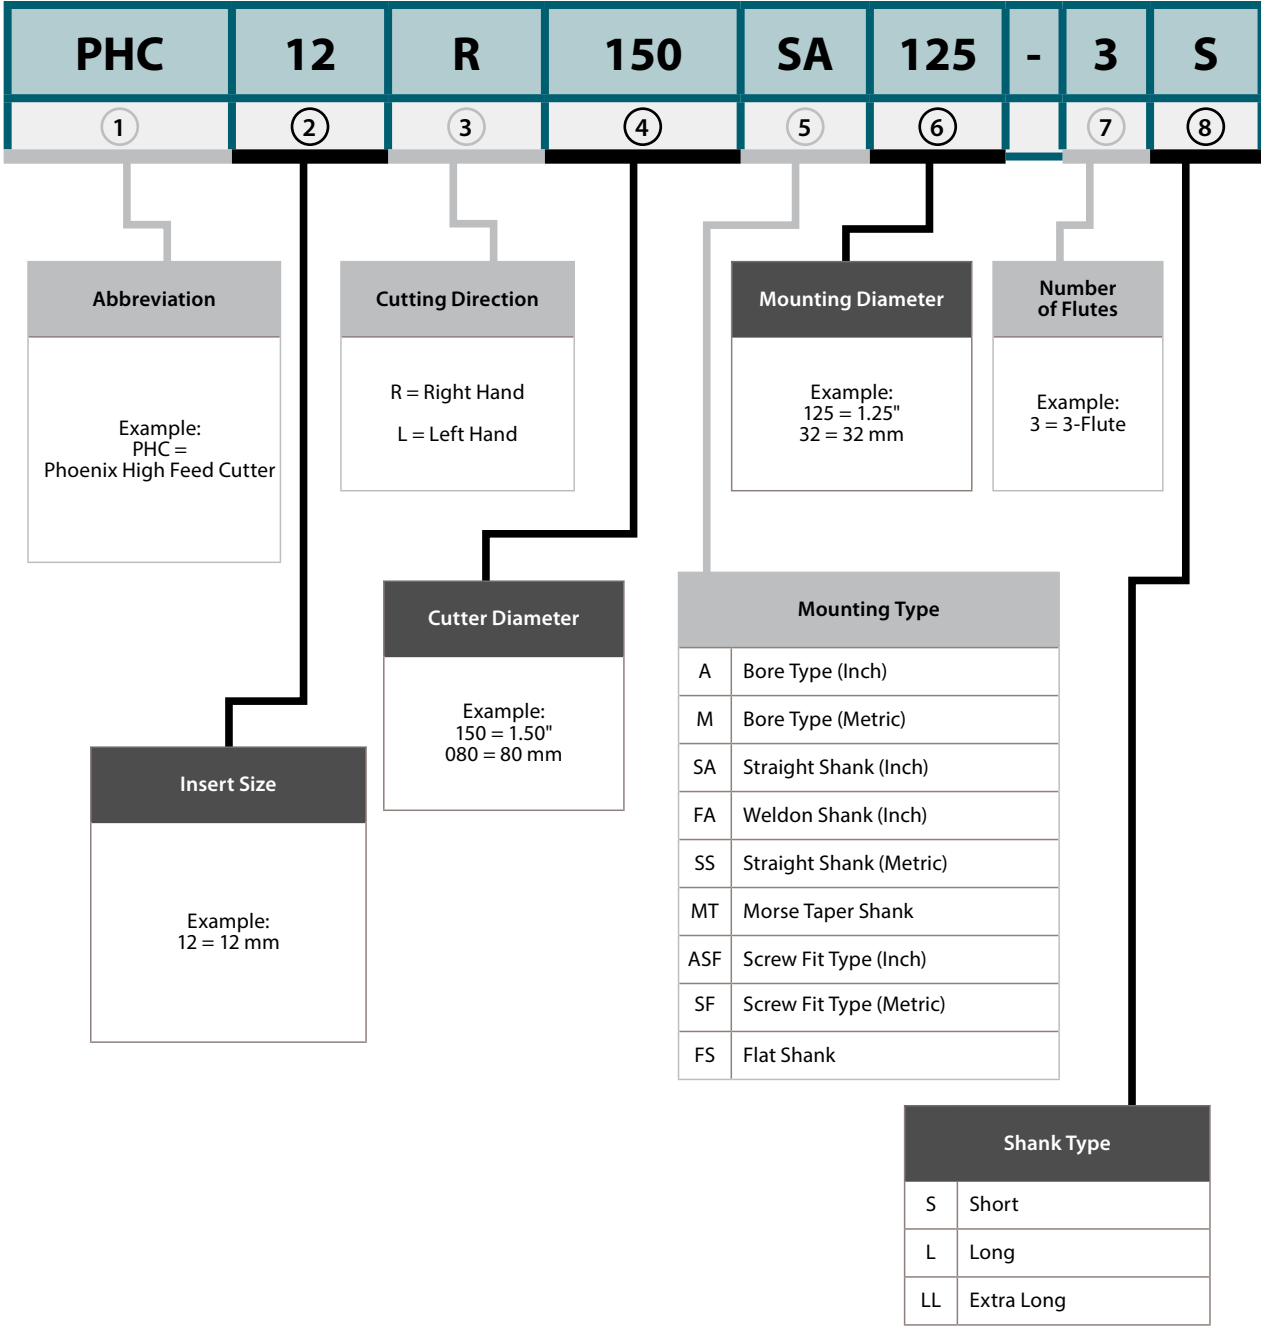

Material Class	Grade	Coating Method	Hardness (HRA)	Surface Treatment		Features
				Main Component	Coating Thickness	
M	XP2025	PVD	91.0	TiAlN	5 µm	For Machining Stainless Steel and Steel Composed of a tough, high-strength carbide material with an anti-chipping and wear resistant coating.
	XP2040	PVD	89.6	TiAlN	5 µm	For Machining Stainless Steel and Steel Ideal for general-purpose milling. Composed of a tough, high-strength carbide with an anti-chipping and wear-resistant coating.
	XP2225	PVD	91.5	Cr	3 µm	For Machining Stainless Steel Composed of a heat-resistant carbide material with a heat-resistant and wear-resistant coating.
K	XC1015	CVD	91.5	TiCN + Al ₂ O ₃	10 µm	For Machining Cast Iron Composed of a tough, high-strength carbide material with an anti-chipping and wear-resistant coating.
	XP1020	PVD	91.5	TiAlN	5 µm	For Machining Cast Iron Composed of a tough, high-strength carbide material with an anti-chipping and wear-resistant coating.
	XP1010	PVD	91.4	TiAlN	6 µm	For Drilling Cast Iron Composed of a tough, high-strength carbide material with highly rigid cutting edge and wear resistant coating.
	XP1425	PVD	91.8	Cr Composite multilayer	7 µm	For Drilling Cast Iron Composed of a tough, high strength carbide material with a wear-resistant thick film coating.
	XC9025	CVD	90.8	TiCN + Al ₂ O ₃	6 µm	For Drilling Cast Iron Composed of a tough, high-strength carbide with an anti-chipping and wear-resistant coating.
N	CK010	-	92.0	-	-	For Machining Non-Ferrous Materials Composed of a non-coated carbide material with an anti-chipping and wear-resistant properties.
	XC4505	CVD	93.0	DIA	12 µm	For Machining Non-Ferrous Materials Micro crystal diamond provides a coating layer with excellent strength.
	CK110	-	92.2	-	-	For Drilling Aluminum Alloy and Non-Ferrous Materials Composed of a non-coated carbide material with a sharp cutting edge and polished surface.
	CF225	-	91.8	-	-	For Drilling Non-Ferrous Materials Composed of a non-coated carbide material with an anti-chipping and wear-resistant properties.
S	XC5035	CVD	89.3	TiN + Ti(CN) + Al ₂ O ₃ + Ti(BN)	6 µm	For Machining Heat-Resistant Alloy and Stainless Steel Composed of a tough carbide material with an oxidation-resistant and high-lubricity coating.
	XC5040	CVD	89.3	TiN + TiB ₂	4 µm	For Machining Heat-Resistant Alloy and Stainless Steel Can be used for wet machining. Composed of a tough carbide material with an oxidation-resistant and high-lubricity coating.
H	XP6015	PVD	92.2	TiAlN	4 µm	For Machining High Hardness Steel Composed of a tough, high-strength carbide material with a wear-resistant coating.
	XP6305	PVD	93.0	SiC Silicon-based heat-resistant coating	3 µm	For Machining High Hardness Steel Composed of a tough, high-strength carbide material with excellent thermal conductivity.

Machining Method	Chip Breaker	Cutting Edge Cross-Section (Approximate)	Application
Milling	GL		For milling stainless steel: a breaker with a large rake angle and a small flat land to reduce cutting force.
	GM		For milling various materials from steel to cast iron: a breaker with a superior balance of rake angle and flat land.
	GR		For milling various materials from steel to cast iron: a highly rigid breaker with large rake angle and flat and to provide a sharp cutting edge and enable efficient milling.
	HR		For milling high hardened steel: a breaker with sharpness and excellent rigidity.
	SM		For milling difficult materials: a breaker with a sharp cutting edge to reduce cutting force and provide smooth chip evacuation.
	NM		For milling non-ferrous materials: a breaker with a sharp cutting edge and a large rake angle to suppress welding, improve the milling surface and prevent burrs.
Holemaking	DM		For drilling various materials from steel to cast iron: a general purpose breaker with an ideal rake angle.
	DR		For drilling cast iron: a highly rigid breaker with an optimal land width and rake angle.
	DN		For drilling non-ferrous materials: a breaker with a sharp cutting edge and polish treatment for excellent chip evacuation.

» Mounting Procedure

Step 1	Step 2
 <p>Clean attachment area with an air nozzle. Any leftover cutting chips may prevent the head from being mounted properly and may cause damage to the tool.</p>	 <p>Manually attach the head.</p>
Step 3	Step 4
 <p>Insert the flat metal portion of the designated driver into the groove of the head. Insert the driver firmly into the groove. If the insertion of the designated driver is too shallow, it could damage the flutes.</p>	 <p>Turn the driver clockwise and mount the head onto the body. Mount it firmly and make sure that there is no gap in the area between the head and the body.</p>

Note: Effective cutting diameter is based on cutting depth (Aa)

How to determine effective cutting diameter:

Ex: Dc = 0.500"
Aa = 0.020"
De = 2√(0.020(0.500-0.020))
De = 0.196"

$$De = 2 \sqrt{a_a(D_c - a_a)}$$

Recommended Width of Cut & Surface Roughness

Tool Dia ØDc		Width of Cut Ar		Surface Finish h

-	32 (8F)	1500	18.90	1200	15.35	1000	12.60	800	10.24

1. Cutting conditions shown above are for side milling with $L/D \leq 5xD$
2. For side milling with $5xD < L/D \leq 6xD$, reduce Speed and Feed by 10%
3. For side milling with $6xD < L/D \leq 7xD$, reduce Speed & Feed by 20%
4. For side milling with PXM Extra-Short Collet, increase Speed by 30-40% and Feed by 40-80%
5. For side milling with PXM Short Collet, increase Speed by 10-20% and Feed by 20-30%

Slotting

Hardness		Up to 30 HRC				30-45 HRC		45-55 HRC

-	25	1910	14.96	1530	12.20	1270	9.84	950	7.48
1	-	1880	14.80	1505	11.85	1250	9.70	935	7.36

1. Cutting conditions shown above are for slotting with $L/D \leq 5xD$.
2. For slotting with $5xD < L/D \leq 6xD$, reduce Speed and Feed by 20%.
3. For slotting with $6xD < L/D \leq 7xD$, reduce Speed & Feed by 35%.
4. For slotting with PXM Extra-Short Collet, increase Speed by 10-20% and Feed by 10-50%.
5. For slotting with PXM Short Collet, increase Feed by 15-30%.
6. Slotting with $\varnothing 1\ 1/4"$ or $\varnothing 32\text{mm}$ PXVC is not recommended due to the large number of flutes.

Cutting Conditions (PXSM)

Side milling

EXOCARB[®] DISC CUTTER[®]

Face Mill Cutter for Small Machines

DISC CUTTER[®] PRO

DISC CUTTER[®] S

Revolutionary Face Milling Cutter for Small Machines

Roughing	DISC CUTTER [®] S
Finishing	DISC CUTTER [®] Pro

Why do we need the DISC CUTTER[®]?

Multiple passes on large, wide work pieces are required for small diameter cutter bodies which result in blend lines on the finished part.

Larger cutter bodies remove material in fewer passes, but are typically heavier, requiring more weight and protrusion from the arbor.

On smaller machines, the total tool weight allowance including the arbor is 3kg (6.6lbs). A conventional 125mm cutter is too heavy for these machines.

OSG's Solution

EXOCARB[®] DISC CUTTER[®] solves these issues by designing a lighter, large diameter cutter without sacrificing rigidity.

Thin, Light and Steel Body

DISC CUTTER[®] S, $\phi 125\text{mm}$ = 1.0kg (2.2lbs)
DISC CUTTER[®] PRO, $\phi 125\text{mm}$ = 1.3kg (2.86lbs)

Arbor = 0.6kg (1.32lbs)

Less than 1/2 of the weight compared to competitors.

Short reach results in high rigidity.

High rigidity allows High - Speed & Feed milling.

DISC CUTTER® S

- Roughing
- Carbide Insert
- No Height Adjustment

DISC CUTTER® PRO

- Finishing
- PCD Brazed Insert
- Height Adjustment

Arbors

3 pin technology securely supports the cutter body while minimizing gage length.

Optional Internal Coolant Supply Clamping Bolt

The internal coolant supply improves surface finish and tool life by cooling the cutting edge & evacuating the chips.

Performance

DISC CUTTER® S	
Tool	DC-S 125 x SL x 5J (125mm)
Insert	Carbide
Work Material	A7075
Speed	8,000 RPM
Feed	158 IPM (0.004 inch/t)
Depth of Cut	3mm (0.120 in)
Width of Cut	100mm (4.000 in)
Machine	Vertical Machining Center BT30 5.5kw

MRR : 1,200cm³/Min

DISC CUTTER® PRO	
Tool	DC-P 125 x SL x 5J (125mm)
Insert	PCD
Work Material	A7075
Speed	5,000 RPM
Feed	100 IPM (0.004 inch/t)
Depth of Cut	0.5mm (0.02 in)
Width of Cut	100mm (4.000 in)
Machine	Vertical Machining Center BT30 5.5kw

Surface Roughness : Ra 0.171um

Packed: 1 pc.

1. For center-through coolant system, please insert tool all the way to the back of the collet.

Coolant leakage may occur if the tool insertion length is too short.

2. Select the appropriate collet after confirming the dimensions of the tap to be used.
3. Confirm the tightening torque with a torque spanner wrench or similar tool.

HR-B Handy Unit

Features

- Small Foot Print
- Light Weight
- 120 V AC Current
- Easy-adjust slide

Benefits

- Fits on a table top
- Portable
- Works with any standard wall outlet
- Fast and simple height adjustments
- Cost effective!

Machine Specifications

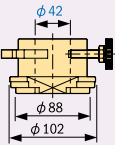

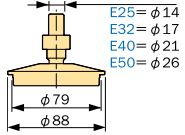

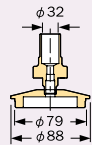

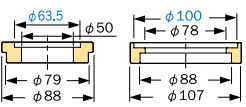

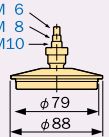

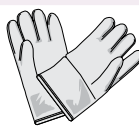

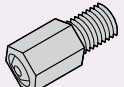

EDP Number	68802B
Name	HRB-025-120NA SHRINK UNIT
Voltage required	120V
Power rating	1200W
Dimensions	362mm x 105mm x 570mm
Shrink fit capabilities	All OSG HY-PRO® Shrink holders
Heating cycle time	120 seconds
Included Accessories	Heat resistant gloves, timer, tool tweezer
Weight	16.5 lbs.

Safe Use of Shrink Devices

- 1** DO NOT allow contact between hot air from the system and the body as there is a possibility of burns.
- 2** DO NOT use this system near flammable gases and substances.
- 3** DO NOT apply water to the system.
- 4** Recommended cool-down time is five minutes.

HR-B Handy Unit Accessories

	Item Name	EDP No.	Size	Specification
 	Base	9910232	BAA-01	To hold the appropriate adapter for positioning a shrink fit holder or extension during assembly and disassembly.
 	Adjustable Base Adapter	9910222	BAS-02	To position 10-40mm straight type shrink extensions during assembly and disassembly. Can be used in conjunction with the BAA-01 base.
 	Adapter	9910224	ADH-HSK25	Used with HSK25 series tool holders. It fits into the top of the BAA-01 Base and accepts the tool holder.
	Adapter	9910225	ADH-HSK32	Used with HSK32 series tool holders. It fits into the top of the BAA-01 Base and accepts the tool holder.
	Adapter	9910226	ADH-HSK40	Used with HSK40 series tool holders. It fits into the top of the BAA-01 Base and accepts the tool holder.
	Adapter	9910227	ADH-HSK50	Used with HSK50 series tool holders. It fits into the top of the BAA-01 Base and accepts the tool holder.
 	Adapter	9910228	ADH-BT30	Used with BT30 series tool holders. It fits into the top of the BAA-01 Base and accepts the tool holder.
 	Adapter	9910229	ADH-40	Used with BT40 and CT40 series tool holders. It fits into the top of the BA-01 Base and accepts the tool holder.
	Adapter	9910230	ADH-50	Used with BT50 and CT50 series tool holders. It fits into the top of the BA-01 Base and accepts the tool holder.
 	Base Adapter	9910220	ADH-SLK	Used with regular, flush and slim type shrink extensions. It fits into the top of the BAA-01 Base.
	Heat Resistant Gloves	8910171	HBT-01	
	F Type Nozzle	9910205	NOZ-M4-12	Optional nozzles for BT and HSK Flush Type Holders

Holders

Type	Specifications	BT, CT Holders	HSK Holders
Basic Holders	Holder for Shrink Extension (without nozzle)	BT-30, -40, -50 CT-40, -50 	A63, A100 F63M
Nozzel Holders	Holder for Shrink Extention (Coolant Supply Nozzle is Optional)	BT-40, -50 CT-40, -50 	A63, A100

Extensions

Type	Application	Dimension/Size
Regular Type	For General Operations and Coolant-Through Tool	 \varnothing 1.5 inch/metric
Slim Type	Use this type when a slim holder is needed to avoid interference between the tool and the work piece	 \varnothing 1.5 inch/metric
Flush Type	Use this type when you want coolant supplied from the end face of the extension	 \varnothing 3.25~4 inch/metric

For Small Shank Diameter use h6 Shanks

The HY-PRO[®] Shrink System can be used for tools with a minimum shank diameter of 3mm. If the shank diameter is between 6mm and 12mm, the system requires at least an h7 shank tolerance. For Ø3-Ø5, use h6 shank tolerance. A wide variety of tools are applicable.

Various Coolant Supply Devices

Through the Tool

Suitable when using a tool with internal coolant to supply the point of the cutting edge. This is especially effective for drilling because the coolant is guaranteed to reach the cutting area.

Through the Holder

Supplies coolant from the front face of the holder. This is used for tools without internal coolant supply and regular or slim type extensions.

Through the Collet

Supplies coolant from the front face of the shrink extensions. Although the diameter of the collet end face increases, coolant supply becomes even more effective.

Do-It-Yourself Extensions

Notes

If necessary, the shape of the shrink extension can be easily modified. This design provides the best holder shape for operations that have major interference with work materials.

1. The shape of the flush collet cannot be adjusted.
2. Other adjustments should be based on the ranges described below.
(Wall thickness should be at least 1.5mm)
3. DO NOT change the overall length.
4. For details, please refer to the instruction manual attached to the product package.

Recommended Cutting Conditions for Extension Modification

Notes

1. The cutting depth should be kept small.
2. Use water soluble coolant.
3. Use positive-rake inserts for stainless steel.

Cutting Speed (m/min)	Cutting Speed (m/min)	Feed (mm/rev)	Cutting Depth (mm)
Roughing	30 - 50	0.1	0.2
Finishing	30 - 50	0.05	0.1

HY-PRO® Shrink - Proper Care Information

Please follow these guidelines to ensure your HY-PRO® Shrink extensions stay looking and performing like new for years to come:

- When not in use, remove tool and clean/dry the inside & outside of holder as thoroughly as possible. Apply rust-proofing oil (WD-40® for example) to help inhibit oxidation. Excessive internal rusting will lead to hairline fractures in the steel.
- Be sure to use cutters with shank diameters that adhere to ISO tolerance requirements. Remember, HY-PRO® Shrink holders are made to accommodate the following:

ø3~5mm	→	h6 tolerance ONLY!
ø6~25mm	→	h7 tolerance ONLY!

- Failure to use tools that adhere to these standards may result in complications with respect to inserting and removing tools.
- Be sure to observe minimum chucking lengths on extensions. Failure to do so can result in poor accuracy, deformation, or cracking of tool or extension.

Care Tips:

- Simple household bleach will remove oxidation from the outside of extensions. Use it to clean metal powder and debris from the insides as well to help prevent scratching & abrasions.

- Be sure to keep threads on the end of the extensions well oiled to allow for easy installation and removal from the holders.
